EXECUTIVE BRIEFING

■ Moving a step closer to true EDI, Phillips Petroleum and Manufacturers Hanover Bank have come up with an electronic data interchange system that goes beyond ordering and billing. Under the pilot project, Phillips is using electronic funds transfer to pay its suppliers. Full implementation of EDI has been hampered by the inability of most banks to marry such an electronic payment application to the exchange of data relating to orders and invoices. Page 1.

■ It's Comdex week, but much of the industry-rocking PC news hit the street last week. Compaq Computer Corp. not only announced its long-awaited Intel Corp. 486 and Extended Industry Standard Architecture (EISA) systems but set its sights on markets beyond the PC world — with claims that its new high-end system outperforms many traditional minicomputers. Page 1. Elsewhere, the 486 and bus wars heated up when NCR Corp., NEC Technologies, Inc. and Grid Systems Corp. announced 486 machines. However, while NCR opted for IBM's Micro Channel Architecture bus, NEC and Grid both went with EISA. See stories pages 134 and 135.

■ Why has automation failed to enhance office productivity in the U.S.? Lester Thurow, dean of MIT's Sloan School of Management, argues that computers have focused on simply producing more information in the existing structure rather than making the necessary fundamental changes. Page 87.

■ In 13 federal government agencies, complacency is the problem, according to the General Accounting Office. The GAO unveils its "Hall of Shame," listing cases of IS "buying new stuff to do the same wrong thing faster." Page 87.

■ Few IS organizations control desktop computing in their companies. Their ability to ensure the security and effective use of corporate information systems depends at the PC. Many IS managers — frustrated by end users who clamor for support but prefer devising their own solutions — are attempting new strategies. Special Report begins after page 86.

■ Potential DEC VAX 9000 customers must wait until spring for the VAX 9000, but they are confident that the new operating system will help solve DEC's traditional I/O bottleneck for commercial transaction processing. Page 25.

■ An MBA can open doors to management or bring a larger starting salary in some IS organizations. However, in most hiring and promotions, experience is weighed far more heavily than an MBA, according-to-a number of observers. The value of an MBA that lies in parlaying the education into solid business experience. Page 133.

US West's light-owl architect Bill All.

The topsy-turvy world of end-user computing sends IS professionals spinning. Special Report begins after page 98.

Get ready for a blitz of retrospectives and predictions during the final six weeks of this decade. Here is what was predicted for the computer industry when the '80s began: Open systems standards would greatly influence product offerings. Supercomputers would feature gallium arsenide and super-cooled Josephson Junctions. Artificial intelligence would become a standard feature. The Japanese would enter Western software and hardware markets. Micros would be available for homes and cars. And the merging of technologies would break down the DP manager's bastion of power — the glass house — forever.

Systems software for MVS data centers:

Wang trimming its 'waste-line'

BY NELL MARGOLIS
CW STAFF

BOSTON — Wang Laboratories, Inc. last week offered up its prescription for saving the gravely ailing company: a streamlining of operations that will eliminate 2,000 jobs and will add to gross revenues enough cash to Wang's technology.

Dubbed "Operation Costcut" by company President Richard Miller, who was named to the job in August, the plan targets Wang's vaunted bureaucracy and sets a goal of cutting out every bureaucratic layer not indispensable to users.

The 2,000-person layoff, to be effected by Jan. 1, will hit corporate positions across the board, with the noted exceptions of development and sales/support, "both of which are sacred," Miller said.

The plan will trigger a one-

time charge against earnings, estimated at \$30 million and scheduled to be taken in Wang's second fiscal 1990 quarter, ending Dec. 31. However, Miller said he expects the savings to exceed \$30 million, which he termed a "revolution" to save Wang some \$115 million annually.

"He's hitting the right places," said Stephen L. Koller, director of information services at Stamford, Conn.-based International Executive Service Corps.

Koller, whose company is "heavily invested in Wang," said that he thinks whether 2,000 is a deep enough cut to render Wang profitable by spring, a Miller estimate reiterated sever-

ally at last week's briefing.

"I think he's excellent — tough, open, exactly what they need," Koller said. "People I've talked to at Wang — developers and salespeople — tell me that he's done wonders for morale; they say the whole environment's turned around at Lowell headquarters since he started."

Miller conceded the irony of calling customer satisfaction "revolutionary." The seemingly obvious acknowledgment that "our customers are our lifeline" has, he said, gone strangely un-

noticed at Wang.

"On the other hand, he added, "There is not the slightest bit of evidence that this is going to happen."

"It's odd that this is the first time he's been here in five years," noted Jerry Springer, director of computer services at the University of the Pacific in Stockton, Calif. He added, however, that he believed Blumenthal's appointment was a positive gesture, and that he believed that, there was little the chairman could accomplish in a user forum.

"The people here couldn't care less about the financial details unless it's a matter of the company's going out of business, and Unisys isn't on its way out," he said.

"I did come here concerned, very skeptical about the future of this company," said Paul E. Moore Jr., vice-president of The Huntington National Bank in Columbus, Ohio. Any sign of financial stability on Unisys' part is unwelcome to his bank, which he recently signed on for Unisys' new imaging system. "Blumenthal, though, was very reassuring," he said.

Although his concerns were substantially allayed by Blumenthal's speech, Moore said, "We're still going to lose a lot of their revenue hopes on hardware." Although he was not able to attend the meeting, Blumenthal said that company advisors had told him, "You'd better deal with the question of whether or not Unisys is a takeover target." Well, I can't deal with that question. I can't swear that won't happen, when we know all too well that no company is in the

al times at last week's briefing.

Miller said no further layoffs are planned but that further changes are likely for the company as it responds to the "constant change" of the industry.

Koller said he is inclined to give Miller the benefit of the doubt for now.

"I think he's excellent — tough, open, exactly what they need," Koller said. "People I've talked to at Wang — developers and salespeople — tell me that he's done wonders for morale; they say the whole environment's turned around at Lowell headquarters since he started."

Miller conceded the irony of calling customer satisfaction "revolutionary." The seemingly obvious acknowledgment that "our customers are our lifeline" has, he said, gone strangely un-

noticed at Wang.

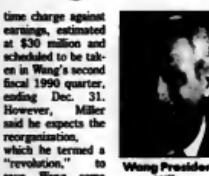

"Those Wang people who are close to the customer often lack technical expertise, and those with technical expertise often lack contact with the customer," Miller said.

Wang, Miller said, "now has over 800 product development programs, but only 72 of these ... originated in a formal review process to determine whether or not customers really wanted the products being developed."

If recent history is any guide, Miller said, less than 10% of 300-plus new product introductions currently backlog will earn more than \$1 million in revenue for the company.

But now, Miller said, waste and confusion are about to give way to focus and efficiency.

"Mr. Miller's got his work cut out for him," said Joseph Preski, vice-president of information services at Nelson Entertainment Co. in Beverly Hills, Calif. "If someone is ill, you don't get encouraged because a doctor says, 'You should've come to me three years ago, and I could've cured you; now we'll have to amputate.'"

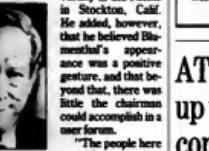

BY NELL MARGOLIS
CW STAFF

ORLANDO, Fla. — Unisys Corp. Chairman W. Michael Blumenthal told customers last week that the company's recent \$648 million quarterly loss marked the end of the beginning of the new Unisys, not the beginning of the end.

A record 2,100 or more turned out at a Cooperative Users of Business Equipment (CUBE) semiannual meeting to hear Blumenthal address the group for the first time in five years. Many users remained skeptical, some even disgruntled at the chairman's failure to tell them much that they did not already know. But many others came away with a brightened view of the firm's prospects.

In reviewing the company's problems, he emphasized that "in one fell swoop, we reduced our break-even point by \$1.5 billion if not more." That, he said, is a measure of progress to date.

Blumenthal also tried to dispel the notion that he appeared at the meeting, he said, to impress his company's advisors and told him, "You'd better deal with the question of whether or not Unisys is a takeover target." Well, I can't deal with that question. I can't swear that won't happen, when we know all too well that no company is in the

country as invulnerable."

On the other hand, he added, "There is not the slightest bit of evidence that this is going to happen."

"It's odd that this is the first time he's been here in five years," noted Jerry Springer, director of computer services at the University of the Pacific in Stockton, Calif. He added, however, that he believed Blumenthal's appointment was a positive gesture, and that he believed that, there was little the chairman could accomplish in a user forum.

"The people here couldn't care less about the financial details unless it's a matter of the company's going out of business, and Unisys isn't on its way out," he said.

"I did come here concerned, very skeptical about the future of this company," said Paul E. Moore Jr., vice-president of The Huntington National Bank in Columbus, Ohio. Any sign of financial stability on Unisys' part is unwelcome to his bank, which he recently signed on for Unisys' new imaging system. "Blumenthal, though, was very reassuring," he said.

Although his concerns were substantially allayed by Blumenthal's speech, Moore said,

"We're still going to lose a lot of their revenue hopes on hardware."

Miller time

* July 1985: John Cunningham, would-be successor to Chairman A. Wang, departs Wang Laboratories; Frederick Wang becomes president in 1986.

* Spring-fall 1989: 5,000 jobs are cut through layoffs and attrition.

* August 1989: Fiscal year loss of \$424.3 million; Fred Wang replaced by Miller.

* September 1989: \$175 million credit line granted.

* October 1989: \$62.1 million first-quarter loss.

* November 1989: Corporate reorganization and 2,000-job workforce cut.

AT&T hooks up with SNA connectivity

BY JOANNE M. WEIKER
CW STAFF

AT&T last week opened the door to IBM's Systems Network Architecture (SNA) connectivity for a little wider of users of its Unix computers.

Falling in with other vendors

of proprietary networks that have seen the wisdom of linking users to competitors' devices on the corporate network, the firm announced new and enhanced software that allows AT&T's Unix System V servers and Stargroup local-area networks to connect to IBM mainframes.

The Stargroup Software SNA Gateway allows 386 Stargroup servers to act as SNA gateways. It also provides MS-DOS work-

stations with IBM 3270 terminal emulation and connectivity to SNA hosts when connected via Stargroup LANs.

AT&T's enhanced Host Connectivity Software offers SNA and Novell-based communications on AT&T's 32-bit minicomputers and 6386 Workgroup Systems, as well as peer-to-peer support of multilayer configurations. Physical Unit (PUs) 2.1 support has been enhanced to connect both subarea networks and peer nodes as a PU 2.1 node and to support all LU types on a single PU 2.1 node.

"The announcement speaks to the trend in corporations to connect PC LANs to the corporate network," noted Michael Howlett, vice-president of marketing for Stargroup Software Inc., a Santa Clara, Calif., market research and consulting firm.

The connectivity software will reportedly allow Unix Mail to run over SNA between Unix machines and take advantage of VTAM 3.2, which resides on IBM mainframes.

Sparc sales flare

San Microsystems, Inc.'s Scalable Processor Architecture (Sparc) design made hay with Asian manufacturers last week with the announcement that Korean electronics giant Goldstar Technology, Inc. plans to market workstations based on the design. Sparc has found homes with such companies as Toshiba Corp., Datatech Enterprises and Tatung Co. planning reduced instruction set computers (RISC) for Asia. Goldstar said its machines are expected in late 1990. Meanwhile, Cypress Semiconductor has sold its version of the MicroMIPS Sparc RISC architecture to Cera Laboratories in Germany. Cypress lead, one of the world's leading particle physics labs. Several hundred networked Sparc controllers will be used with the institution's particle accelerator, a 27-km underground ring that creates new materials by colliding electrons and positrons at high speeds.

Novell links EISA PCs to Ethernet

Novell Communications Products got into the act at last week's media event hosted by Compaq Computer Corp. in Houston with its announcement of a \$12,295 Ethernet adapter for the 32-bit Extended Industry Standard Architecture personal computer platform. The Novell, Inc. subsidiary's NE3200, scheduled for fourth-quarter 1989 availability, was developed jointly with Compaq.

School ties, 1990s style

Students at Case Western Reserve University (CWRU) in Cleveland are communicating over what is being hailed as the first 100% fiber-optic campus network in the nation. Now 30% complete, CWRENet carries data and video signals and will eventually handle voice traffic. Some 8,000 students and 3,700 faculty and staff will be on-line when the network is finished in 15 months. Users will plug into any of the 6,000 ports on the network using AT&T fiber-optic Ethernet adapters. Remote access to electronic mail, on-line library services and bulletin boards. The entire CWRENet project will cost \$12.8 million, university officials estimate.

Armour heads Andersen group

Andersen Consulting announced last week that David H. Armour will lead its \$100 million systems management practice. Armour, 45, will coordinate the consulting company's computer and network operations practices as well as its specialized technical consulting practices. Armour, formerly head of Andersen Consulting's Advanced Systems Group in the southwest region, will also direct Andersen's systems operations, which provides computer and network management services through centers in Chicago, Dallas and Stamford, Conn.

DEC delivers 15,000th Vaxcluster

The snap, crackle, pop was from champagne corks flying when Kellogg Co. of Battle Creek, Mich., and Digital Equipment Corp. joined up in an Anaheim, Calif., gala last week to celebrate delivery of the 15,000th Vaxcluster system. Kellogg will run transaction processing applications via its new Vaxcluster, company officials said. More than half of DEC VAX systems are configured in clusters, and two-thirds of the company's largest 260 accounts use them to manage their business, said Bob Garske, vice-president of high-end systems at DEC.

Back from the brink

More than 10 months after filing for Chapter 11 bankruptcy protection, Leading Edge should officially have new owners next week. Daewoo Telecom Co. Ltd. is expected to receive the formal approval of its acquisition and reorganization plan for the Canton, Mass.-based chose vendor on Nov. 15. The final word, which should come from Korean banking institutions that must locally approve the use of Korean corporate funds in foreign investments, authorizes Daewoo's legal ownership and full-time management of Leading Edge. The reorganized company is now shipping its Model D personal computers and plans to begin shipping new products as early as next month.

DEC users check each other out

BY MARYFRAN JOHNSON
CW STAFF

ANAHEIM, Calif. — The world's largest concentration of Digital Equipment Corp. customers descended on Disneyland last week, with hardly a moment to spare for Mickey, Donald and the gang.

Shuttling between the Dexpo West '89 trade show and the Digital Equipment Computer Users Society (DECUS) meeting, an estimated 7,000 DEC users checked out the latest gadgets in connectivity, software products and hardware enhancements (see story below).

But it was the chance to do a little peer networking that seemed to be the biggest draw.

"Solving one system problem can pay for the cost of the trip," said John Grden, systems manager at Lawrence Technological University in Southfield, Mich.

Common topics bandied about at the users convention and trade show included ways to integrate mongrel workstations and servers with DEC VAX machines, upgrading systems upgrades and integration and ensuring network security. Connectivity products for Apple Computer, Inc. Macintoshes and DEC computers were popular.

Ralph Bradshaw, director of

technology assessment for R.W. Johnson Co., a Raritan, N.J., pharmaceutical research firm, said local-area networks have become "an island of technology."

"We need a seamless network PC and Macs into the same VAX architecture," he said.

"We're really looking for ways to integrate it all," echoed Curtis Beemer, a systems engineering manager at Andrews U.S. Air Force Base. "What I'd like to do is get it down to one terminal on one user desk."

Despite tough times in the computer industry, there was a palpable spirit of optimism at the DECUS meetings. In a survey conducted at the show by DECUS, among those in attendance, 66% of the 350 respondents estimated their information technology budgets would increase faster than inflation.

Vocod-activated computers and laptops were considered the hottest new computer technologies. The Dexpo survey found that 45% of users expressed dissatisfaction with equal concern shown on data integrity and communications security.

Security on the Decnet Internetwork was a theme that

drew hundreds of users to a talk by Ron Tencati, security manager at the Space Physics Analysis Network (SPAN) at NASA's Space Application Research in Lanham, Md. SPAN was hit most recently with a worm bearing an antiautore message and snaring 300 machines on the system by changing passwords.

Tencati scolded the systems managers for ignoring the two major causes of worm attacks: lax system security and sloppy password practices.

Phase V on their minds
Another networking issue on the minds of many users was the upcoming release of Networking Phase V, new system software for the Decnet.

Phase V will bring about "a tremendous number of changes," said Kevin Oberman, network manager for the engineering department at Lawrence Livermore National Laboratories in Lawrence, Calif. "It's not application rewrites but network performance as a whole that will be different."

Meanwhile, in nearby Los Angeles, DEC announced the establishment last week of the first of four in-house "resource centers" for transaction processing customers in Los Angeles, Chicago, New York and Atlanta.

ed performance tenfold for complex queries in certain applications such as large join queries.

• SPSS, Inc., in Chicago introduced a new Unix-based release of its graphics software; SPSS Graphics Release 2.1 adds fully integrated interfaces to Oracle and Ingres DBMSs.

• An e-mail gateway product, called MHS, that connects the DEC Mailbox E-mail system to Networks and other LAN-based mail systems, was presented by Joiner Associates, Inc., in Madison, Wis.

Dexpo lures buyers with promise of VAX ease

BY MARYFRAN JOHNSON
CW STAFF

ANAHEIM, Calif. — Dozens of companies used the Dexpo West forum here last week to introduce products geared to make life easier for Digital Equipment Corp. VAX users.

Announcements included everything from rest-time-on-line performance monitors and new versions of spreadsheets and accounting software to VAX-compatible tools, electronic mail gateways, local-area network bridges, graphical interfaces and alternative database management systems.

Executive Software in Glendale, Calif., introduced a new data-caching system called I/O Express. The host-based system reportedly speeds up disk access and I/O throughput without gobbling memory, although it takes a generous amount — 256 pages of physical memory — to benefit users, according to Executive Software President Craig Jensen.

I/O Express automatically relieves I/O bottlenecks — a problem for on-line transaction pro-

cessing — by transferring part of the work load to unused memory.

Other introductions included: Computer Associates International, Inc., in Garden City, N.Y., debuted Release 1.4 of CA-DB for VAX systems. CA added a performance monitor and boot-

IBM big-risk disk to debut

BY ROSEMARY HAMILTON
CW STAFF

IBM is expected to introduce its long-awaited high-end disk drive this week and, boy, does it have a lot riding on this.

A company spokesman confirmed that IBM has scheduled a large systems storage briefing for Tuesday but declined to elaborate further.

The so-called 3390 could be a multimillion-dollar liability for IBM if the product goes out the door in volume and without glitches. But, based on the drive's history so far, there is no guarantee either will happen.

Earlier this year, IBM halted

a scheduled 3390 announcement at the eleventh hour because of technical problems.

The abrupt cancellation infuriated high-end users, many of whom were counting on delivery of the new drive this year.

IBM compounded the problem by keeping quiet on what exactly went wrong with the drive. Late last month, IBM was still holding firm, but the company would not give any indication of how serious the 3390 situation was.

Given the rocky history of the 3390 disk drive, unspecified problems with its follow-on caused some users to be concerned about IBM's high-end disk drives in general.

DEC's enterprise network architecture to hit the streets

BY ELISABETH HORWITT
CW STAFF

BOSTON — Digital Equipment Corp. is expected this week to provide the first solid evidence that its Enterprise Management Architecture (EMA) will in fact become commercial reality within the next year or two.

DEC is expected to demonstrate some early versions of key EMA components, provide a schedule for shipping a number of other crucial pieces during the next two years and add six more vendors to the roster of those that have committed to supporting its multivendor network management platform.

This first EMA rollout will provide limited functionality compared with the full-blown enterprise-wide management system that DEC is promising over the long term, according to analysts and third-party EMA contractors. The initial pieces will include the following:

- A Decowindows, VxWindows-based workstation that is said to allow the user to call up various network management systems in different windows on the screen.
- Links to the EMA workstation for existing DEC network management offerings such as Etherman, Remote System Manager and Remote Bridge Management Software.
- Formal introductions, including availability dates, of links between EMA and the network management systems of

some of the seven original EMA supporters. For example, TI multiplexer vendor Stratacomm, Inc., and bridge vendor Viasys Corp. are expected this week to announce a joint network management product that will also interface with EMA.

The other EMA partners are Codex Corp., TSB International, Inc., Digital Communications Associates, Inc., Timeplex, Inc. and Siemens AG. Availability dates for the initial multivendor EMA connections are slated for the first quar-

ter of next year, when the first EMA products will ship, according to Steven Mank, director of marketing at Codex.

Chevron Information Technology Co. is interested in EMA but only as one of a number of possible network management solutions, says Jim Minet, which is already installed at Chevron, and some third-party vendors will also be considered, analyst Ken Minet said.

The fact that the TI vendor is on the verge of linking to EMA is of potential use to Chevron, a Stratacomm user. More crucial to the energy company, however, is the speed with which DEC can deliver on its promise of Open Systems Interconnect (OSI) compatibility, since Chevron has made OSI the cornerstone of its multivendor network management strategy.

according to Minet.

The initial EMA release was designed to bring existing Decnet Phase IV networks under EMA and does not provide the OSI compatibility that will be possible with DEC's introduction of Decnet Phase V in the third quarter of next year, according to Steve Wender, a program director at Gartner Group, Inc.

Until then, EMA will not be able to exchange information with non-DEC "elements," or network management subsystems, via the OSI Common Management Information Protocol, Wender said.

A large portion of DEC's announcement this week will consist of a general schedule for rolling out major portions of EMA over the next two years, sources said.

OS/2 marries into DEC family

BOSTON — Digital Equipment Corp. last month fulfilled a portion of its 2-year-old promise to make OS/2-based systems part of the Network Application Services (NAS) family of workstations, with full access to Decnet and NAS-based VAX/VMS services.

DEC announced Decnet for OS/2, which is said to allow Microsoft Corp. OS/2 Standard Edition workstations to participate fully in a Decnet Phase IV network, with the ability to perform task-to-task communications, terminal emulation, multiple-session support, electronic mail and bidirectional file transfer.

DEC also plans within a year to provide "a higher level of integration" between OS/2 clients and VAX/VMS servers by introducing an OS/2 version of its Personal Computing Systems Architecture (PCSA), called "professionals joyce." Radnor said. PCSA, which currently supports MS-DOS, was designed to provide client workstations with transparent access to shared files, as well as NAS-based services such as compound document exchange, on VAX/VMS systems.

Users can expect Decnet for OS/2 to migrate to full Open Systems Interconnect compliance with the advent of Decnet Phase V next year, Radnor said. The product costs \$300 and is scheduled to ship in December, according to the company.

IBM bias charged in Navy specs

BY MITCH BETTS
CW STAFF

WASHINGTON, D.C. — Federal investigations of two U.S. Navy mainframe computer procurements found that the contracts were rigged to favor IBM hardware and lock out IBM plug-compatible vendors, according to testimony at a congressional hearing last week.

In both cases, Navy officials relied on IBM employees to help them write specifications for the contracts, the investigators reported at the first of a series of hearings being held by the U.S. House Committee on Government Operations.

The panel, chaired by Rep. John Conyers Jr. (D-Mich.), is studying allegations of IBM bias that were publicized last year by six plug-compatible vendors (CW, Dec. 12, 1988). The IBM rivals include Amdahl Corp., Vios Corp. (a reminder for Hitachi Data Systems Corp.) and Star-

age Technology Corp.

"The Navy is rife with Blue shops," and Navy officials keep them that way by circumventing procurement rules that require full and open competition, charged Sidney M. Wilson, a spokesman for the so-called Gang of Six.

Navy spokesman Lt. James Womack said the Navy is conducting internal investigations, as well as following the congressional hearings and will take any action necessary to ensure that Navy computer procurements are conducted fairly and in accordance with federal laws and regulations.

William T. Conyers Jr., IBM's vice-president for federal marketing, said IBM has only a 14% market share in the Navy overall and is not the dominant vendor there. Furthermore, he declared, "Institutional bias toward IBM does not exist in the Navy or any other agency."

Roderick acknowledged that

there are isolated procurement problems, but he said that the government is in an intensely competitive marketplace, and no major reforms are needed.

However, committee members said that audits of several Navy procurements and statistics released by the U.S. General Accounting Office (GAO) make it appear that the Navy steers contracts to IBM. "Contract procedures have been violated at least two clearly documented cases in order to illegally favor IBM products," Conyers said.

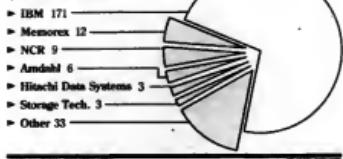

The GAO market survey showed that the Navy has purchased IBM-brand mainframes and peripherals in 171 (or 72%) of 237 IBM-compatible hardware procurements in the last 3½ years. In dollar terms, IBM has 84% of the Navy's market for IBM-compatible mainframe hardware.

In the case of a Navy civilian payroll system, a GAO audit concluded that the Navy improperly

RTI hoists Ingres banner for coming RDBMS wars

BY JEAN S. BOZMAN
CW STAFF

ALAMEDA, Calif. — Nine-year-old Relational Technologies Inc. rebranded its name last week and reached for another battle in the relational database management system wars.

Leaving the name of its DBMS as its new banner, Ingres Corp. switched with a marketing campaign deriding unnamed competitors for making empty promises. That done, it announced that it had enhanced the database engine with two new modules: the rule-based Knowledge Manager and Object Manager, which allows users to define new data types.

However, the corporate makeover contrasted starkly with news that Ingres sustained a \$2 million loss in its first quarter ended Sept. 30 and imposed a hiring freeze.

"We had an internal forecasting problem, and we've since restructured the organization and announced that we're cutting operating expenses by 10%," a spokesman said last week. To correct the problem, 100 of the firm's 1,200 jobs were shuffled, and 70 planned hires will be postponed until the financial picture improves, the Ingres spokesman said. In the process, approximately 15 workers have left the company, he added.

Ingres "has to maintain their focus on their database engine,"

said Rob Anderson, a vice-president at Sutro & Co., a San Francisco investment firm. "That first-quarter loss caught them a little bit by surprise, and that's when a lot of reorganization took place."

Last week, Ingres product manager outlined a number of enhancements to the 2-year-old Ingres 6.0. Release 6.3 will be shipped starting this month.

Highlights of what Ingres is now calling "The Intelligent Database" include the following:

- Enhanced support for on-line transaction applications, an improved two-phase commit protocol to ensure the integrity of distributed transactions and automated access request controls.
- Knowledge Manager, a knowledge management system that allows users to incorporate business rules directly into the RDBMS.
- Object Manager, a knowledge management system that enables users to incorporate business rules directly into the RDBMS.

"We had an internal forecasting problem, and we've since restructured the organization and announced that we're cutting operating expenses by 10%," a spokesman said last week. To correct the problem, 100 of the firm's 1,200 jobs were shuffled, and 70 planned hires will be postponed until the financial picture improves, the Ingres spokesman said. In the process, approximately 15 workers have left the company, he added.

Ingres "has to maintain their focus on their database engine,"

users to define new data types, such as dates, temperatures and latitude and longitude.

Some beta-test users have had Ingres 6.3 in-house for up to eight weeks. The Public Broadcasting Service (PBS) is planning to port an existing indexed-file database of 13,000 television program records now residing on four Digital Equipment Corp. VAX machines to the Ingres 6.3 release.

The database, called the Network Operations Log Application, stores PBS' international network feeds via satellite.

The enhanced Ingres has "been quite reliable, even in the beta version," said Frank Pellegrino, manager of operations and database applications at PBS' Alexandria, Va., headquarters.

Ingres 6.3 is scheduled to ship by the end of this month for VAXes running DEC's VMS operating system. Ingres 6.3 will be available for Sun Microsystems, Inc. computers by the end of the year and other Unix workstations in 1990. Ingres 6.3 ranges in price from \$5,000 to \$18,000, depending on hardware system size.

Ingres 6.3 will be available as a free upgrade for Ingres Release 6.0 users.

However, purchase of the knowledge and object management modules requires another fee. Knowledge Manager will cost 30% of the Ingres license, and Object Manager is priced at 50% of the license.

group and Mobil's representative to the American Petroleum Institute's (API) Petroleum Information Data Exchange Subcommittee.

"You've got banks out in the middle of nowhere that don't even know what electronic funds transfer is," Walsh quipped. "That is going to be a huge problem." Many of the banks involved are beginning to look into EDI and are still unable to trace data and payments together, he said.

"The superregional banks are still not sure how far they will move into EDI," said Dave Taylor, service director of inter-enterprise systems at Gartner Group, Inc.

Instead, Taylor explained, they are watching their national and international counterparts tackle the technology.

Taylor said that while banking is a natural area to adopt EDI, smaller banks are not moving to the technology because it is simply too expensive to support all of the standards, build expertise and create new business units.

In its program, Manufacturers Hanover uses a translation feature that enables Phillips to use the standard data format, ANSI X.12.4.820. The payment information is in the ANSI format, translated into the appropriate format required by the suppliers.

The bank's move to EDI is more of a positioning for future customer demands than an effort to reap enormous profits today, said Frances B. Silverstein, assistant vice-president and prod-

uct manager for EDI at Manufacturers Hanover. "I don't think that any bank now is going to either have dramatic market share or have enormous profit margins on the business of electronic data interchange," Silverstein said.

"The banks are in the business of EDI because our customers have decided that this is the way they want to move payment and remittance information in the next decade."

Over time, revenue will be complemented, Silverstein predicted, but for now "we simply want to be a strong player."

Profiting by EDI

The profits are likely to be found in the technical and consulting services area of EDI, Taylor said, will be in the handle the problems caused by reconciliation of electronic and paper transactions. "If you move EDI data, but you handle checks in paper, how do you make sure that the electronic information and paper information are reconciled? You need to build a system to do that."

Benefits to Phillips from the EDI program at Manufacturers Hanover will likely include savings in check preparation, mailing and reconciliation costs.

In the petroleum industry overall, a study conducted two years ago by the API showed that the potential savings to the industry could be over \$500 million per year through EDI, said John L. Oshinski, coordinator of EDI at the API in Washington, D.C. More than 250 companies in the petroleum industry participate in EDI projects, Oshinski said, with a monthly transaction volume approaching two million records.

SAA. Oracle has it today.

structured Query Language, or SQL. Then, in 1979, two years before IBM delivered SQL/DS, Oracle Corporation delivered the first commercial implementation of SQL and has since become the largest database company in the world.

In 1988, IBM again produced a blueprint for the future of heterogeneous computing: Systems Application Architecture, or SAA. Oracle more than endorses this innovative vision. Oracle is delivering it. Today.

IBM's goals for SAA: "Applications that can be ported with less effort; applications that can span systems; user access to these applications that is simpler and more uniform; and programming skills that have broader applicability."

ORACLE is the only database software that runs on mainframes, minicomputers and PCs. In fact, ORACLE provides data transparency across your MVS, VM, VSE, and OS/2 environments in addition to over 80 other platforms and operating systems. Today.

More than just a software company

Oracle offers more than just software. We offer solutions. No other database company can offer a full suite of services including systems integration, education, consulting and the #1 customer support² in the industry. Which is why Oracle has become the largest database company in the world.³

Just as SQL was the future of data management in 1978, SAA is the future in 1989. Make an Oracle seminar part of your future, today. Call 1-800-345-DBMS to reserve your seat in the next *Oracle* seminar in your area. So you won't be somebody else's first customer, tomorrow.

Viruses shut out college in two matches

BY MICHAEL ALEXANDER

OF STAFF

WORCESTER, Mass. — In a match between viruses and personal computers at Worcester Polytechnic Institute last week, the viruses won big.

The viruses — the Ping-Pong and Pakistan Brain — hit "many hundred" PCs used by students and faculty at the engineering college in central Massachusetts, said David Cyganek, vice-president of information systems and services. The viruses rank among the 10 most prevalent ones, according to the Computer Virus In-

dustry Association.

About 30 PCs in the college's main library were hit by the Pakistan Brain, a virulent and destructive virus that is designed in part to corrupt the boot sector of a hard disk drive and delete programs and files. "It wiped out every PC in the library," Cyganek said. The virus displays a message indicating that it was created by a programmer who was working for Brain Computer Services in Lahore, Pakistan, as a form of protest against software piracy.

The Ping-Pong virus — which occurs

in other forms variously called the Italian, Bouncing Ball and Vera Cruz — infected hundreds of the 1,200 PCs on campus. It is highly infectious but is not designed to destroy programs or data. "When it appears, what you see is a small Ping-Pong ball that careens from corner to corner of the screen," Cyganek said.

The virus hit stand-alone, "open access" PCs used by students and faculty. "It took a while for word to reach us in the academic computer department, but after we found out about it, we shut down every PC to stop its proliferation,"

Cyganek explained.

The PCs in the library and open access areas were out of commission for about two days while IS personnel installed protective and removal software on each PC.

Following the two episodes, IS personnel loaded all of the college's PCs with antivirus software that scans disks before they are used to help prevent the virus' recurrence. "Our days of innocence are over," Cyganek said.

Caution urged with virus laws

BY MITCH BETTS
OF STAFF

WASHINGTON, D.C. — The Computer and Business Equipment Manufacturers Association (CBEMA) last week urged legislators trying to outlaw computer viruses to take care in crafting approach and avoid overly broad remedies.

John Pickitt, president of CBEMA, criticized several of the bills recently introduced to criminalize computer viruses and other forms of malicious programming. "Like the swine flu vaccine of the late 1970s, these antivirus bills could end up doing more harm than good," he testified during a hearing held by the House Subcommittee on Criminal Justice.

Pickitt said that banning the programming techniques used to create viruses may prevent the use of similar techniques for beneficial purposes, including the distribution of a vaccine. Furthermore, outlawing the distribution of computer programs may restrict the free flow of information among researchers, he said.

Free speech?

Similarly, the Computer Professionals for Social Responsibility (CPSR), a group based in Palo Alto, Calif., said Congress should be wary of outlawing benign viruses. A self-replicating computer message, for example, could be a form of free speech protected by the U.S. Constitution, noted Marc Rotenberg, director of the CPSR's Washington, D.C. office.

With a little fine-tuning, current laws such as the Computer Fraud and Abuse Act of 1986 and older statutes against wire fraud may be sufficient for prosecuting virus cases, Pickitt said. On the other hand, the software trade association Adapto reiterated its view that the Computer Fraud and Abuse Act needs substantial modification to combat viruses (CW, July 24). Similarly, the EDP Auditors Association said that the 1986 law has some flaws that make prosecuting virus cases difficult.

Carolyne Conn, testifying for the auditors group, said experience with the 1986 Internet worm shows that antivirus legislation needs to focus on networks as well as host computers and needs to cover both intentional and negligent acts.

Pickitt urged Congress to allocate funds for more federal computer-crime investigators and prosecutors and for more computer security research at the National Institute of Standards and Technology. "I would recommend that Congress wait until there is more case law under the 1986 act and until more of the state statutes have been tested before enacting new computer security legislation," Rotenberg testified.

With System 1032, now it's easy to get a grip on 25 billion long-distance call-minutes.

How does the US Sprint network modeling group keep track of some 25 billion call-minutes per year? Quite simply, in split seconds via System 1032 from CompuServe Data Technologies.

Using System 1032 AGL/REDMIS VAX software, the US Sprint network modeling group created an extensive network modeling system that increased the speed and efficiency of its work in forecasting and planning for the growth of US Sprint's vast fiber-optic communications network.

Think Big. "The total breadth of the data that System 1032 can handle on our network performance is of a staggering magnitude," said Michael Kovich, manager of database design.

Network performance data alone amounts to more than 1.5 million bytes a day, Kovich said.

Think Fast. "What's important to us is that the mass of data be assessed and made available every morning like clockwork. So the software system's efficiency, reliability and quality help us meet our goals and objectives using the most up-to-date information."

East of use in the VAX environment, and in the VMS environment, are additional phases for System 1032.

According to Kovich, "System 1032 was far easier for us to learn and also quicker in what we wanted it to do. The first time we used it, we were building datasets within 30 minutes."

Think System 1032. If you have a large, sophisticated RDBMS application you need to run day-in, day-out, do not let System 1032 call on System 1032 from CompuServe Data Technologies.

CompuServe Data Technologies

1000 Massachusetts Avenue
Cambridge, MA 02138

Think Big. Think Fast.

Think System 1032.

PDSFAST

It's About Time!

PDSFAST Is About Time and Money Saved by 1 Out of Every 3 MVS Users in the Following Critical Areas.

• DASD/SPACE Management-PDSFAST interfaces transparently with all existing DASD Management systems, reclaiming more space and saving up to 90% of the time and resources used. SPEAK TO ANY OF THE OVER 4,500 CONTRACTED PDSFAST USERS WHO, COMBINED, HAVE VIRTUALLY EVERY MAJOR DASD MANAGEMENT SYSTEM AVAILABLE, AND THEY WILL TELL YOU "No DASD management configuration is complete without PDSFAST."

• CICS/DATABASE Libraries — PDSFAST copies and compresses CICS and Database libraries in a fraction of the time presently used. Typical elapsed time for a copy or compress of screen libraries, and other similar datasets goes from about 40 minutes to under 1 minute. PDSFAST eliminates unnecessary system downtime spent waiting for copy and compress operations to complete.

• IEBCOPY/SPFCOPY — PDSFAST will replace all batch and interactive IEBCOPY and SPFCOPY/COMPRESS functions. PDSFAST will save over 80% of the time and resources presently used.

• SMP Processing — SMP and SMP/E both dynamically invoke IEBCOPY thousands of times during a typical run. PDSFAST reduces SMP and SMP/E run time and resource consumption by over 75%.

PDSFAST is now used at over 4,500 MVS installations worldwide. PDSFAST provides a competitive advantage for MVS installations of all sizes, saving many thousands of dollars in data center resources daily. PDSFAST is also saving thousands of individuals many hours of unnecessary time spent waiting for work to be completed.

***Isn't It About Time You
Had The PDSFAST Advantage!***

Products Licensed In Over 40 Countries

AI Corp. links up to VAX systems

BY ROBERT MORAN
CH STAFF

BOSTON — AI Corp. last week announced several cooperative processing enhancements and a way to tie together knowledge-based processing on IBM mainframes and Digital Equipment

Corp. VAX computers.

AI, which is based in Waltham, Mass., said that it has incorporated its KBMS knowledge-based software and Intellect, its natural language software, into KBMS/VAX, a KBMS version that will be available in the first quarter of 1990

and interface with DEC's RDB and Oracle Corp. databases.

Beta-test user Jeff Grier, a senior staff specialist in the expert systems integration group at MCI Communications Corp., said that KBMS/VAX will allow MCI to exchange information between its IBM mainframe and

VAX systems, leveraging the company's investment in KBMS skills.

"We are thinking of running knowledge bases on the VAX servers, on which we will do most of the processing, and then go to the mainframe for the business data," Grier said. "MCI has a heavy investment in VAXes — in fact, they run our network — and this will let us spread our

investment in the technology on the network."

KBMS/VAX is expected ship in the first quarter of 1990 and will cost from \$5,000 to \$75,000, depending on the size of the processor.

In addition, AI said that it will provide remote database access to either KBMS or Intellect running on a personal computer or the mainframe transparently to the application program, starting with the LU2 communications protocol in the first quarter of next year and LU6.2 in the second quarter of next year. Either methodology will cost \$25,000.

The company also announced that KBMS/PC under OS/2 Extended Edition has been enhanced with KBMS Developer Graphics, a facility that permits developers to graphically display

Zero Defects save Time and Money

Put your MVS environment on the fast track to zero defect production control and maintenance. Beta 91 integrates with the proven productivity tools from BETA Systems. We're already helping more than 500 MVS installations achieve the zero

defect goal - with powerful, easy-to-use systems for preventing and detecting errors. Our systems estimate labor-intensive, error-prone tasks such as printing and error-free. Your company holds on to years of experience regardless of staff changes. BETA 91 easily adapts to any application changes.

BETA 91®

Automated Defecting and Quality Management System

BETA 91 easily adapts by automatically identifying any breakdown in the manufacturing process. The most reliable and efficient automated balancing and quality control system available today, BETA 91 replaces manual methods with efficient automated balancing methods with efficient automated balancing procedures. You transfer your

staff's valuable knowledge and experience into a data base which BETA 91 uses to prevent and detect errors quickly and error-free. Your company holds on to years of experience regardless of staff changes. BETA 91 easily adapts to any application changes.

BETA 92®

Job History and Output Management System

BETA 92 easily adapts with paperless, full, reliable BETA 91 products, making BETA 92 Job History and Output Management System offers online control and fully automated archiving of your system output. BETA 92 is a comprehensive solution to the labor-intensive problem in post-production: the printing,

end to the expense and difficulty of manually archiving and retrieving printed output. You can have online SYSCUT control in a system that quickly pays for itself by greatly reducing printing, paper, storage and labor costs.

BETA 93®

Report Distribution and Print Management System

BETA 93 assumes that the right reports reach the right users at the right time. BETA 93 estimates the separation, sequencing, distribution and delivery of reports and documents. BETA 93 is a comprehensive solution to the labor-intensive problems in post-production: the printing,

distributing, banding and mailing of large amounts of paper. You save simply by printing only those pages which are needed and eliminating those pages which are not required, and improving communication. Finally an end to the question: "Where's my letter?"

I would like increased efficiency and savings of zero defect production control and maintenance opportunities.

Yes, tell me more about BETA Systems Software:

- All three systems
- BETA 91 Automated Defecting and Quality Management System
- BETA 92 Job History and Output Management System
- BETA 93 Report Distribution and Print Management System
- Please tell me that your services and support are as good as they say they are

and model objects and their relationships within applications, and KBMS Active Objects, an object-oriented tool for the development of graphical user interfaces for KBMS applications.

Both facilities are scheduled for availability in the first quarter of next year at no charge to current KBMS/PC users under OS/2 Extended.

The workstation capability will be included in Intellect/PC, a workstation version of the company's Intellect 4000 mainframe software that will become available in the second quarter of next year under OS/2 at \$5,000 per copy and under MS-DOS at \$3,500 per copy.

Fere Doon Khosravi, senior information systems analyst at Southern California Edison, said that the company had been discussing OS/2 local-area network applications but did not have a knowledge-based system to complement the company's overall systems strategy.

"The fact that we have had to start over and give up the graphics has been a KBMS downfall," Khosravi said. "Graphics and the remote connection to the host will allow us to look at many other developments that we have had to hold." He estimated that IBM Personal Systems/2 will need 8M bytes of memory to efficiently run KBMS.

Got it?!

Now you can use old friends
to access corporate data.

There you are cranking along at your desktop. Then it happens. You realize you need some critical data that resides on your mini or mainframe.

And you can't get it.

Unless of course you've got ORACLE.® For the first time PC and Macintosh users can access ORACLE and IBM® data from any of their favorite desktop applications.

You can query and update data on ORACLE, DB2™, and SQL/DS databases, using the applications you know and love, including Lotus 1-2-3™, 4th Dimension™, Hypercard™, Supercard™ and dBASE III Plus™. Your entire company's wealth of information is available immediately. Without leaving the desktop.

With ORACLE for Macintosh, you'll be using one of the most popular user interfaces to access corporate data. Give it a test run with the Developer's Version for just \$199.

Or, you can have the Full Networking Version for only \$999. If you're a 4th Dimension user, consider ORACLE for 4th Dimension, the easiest way to access corporate data through familiar 4D applications. Also \$199.

On the PC use ORACLE for 1-2-3 for complete access to SQL databases from your familiar 1-2-3 interface. Or ORACLE dBXI, for giving dBASE III Plus applications access to your ORACLE and DB2 databases. Each for only \$299.

Give one of these ORACLE products a try for 30 days. Then, if you're not happy, send them back and we'll send you a full refund.

If you're not ready to give up on your old friends, there's only one thing to do. Call 1-800-ORACLE 1, ext. 8163 now. And enter the computing environment of the 90s.

Hitachi Data Systems chief rewrites NAS script

BY J. A. SAVAGE
CHICAGO

SANTA CLARA, Calif. — Going into his first interview since he became president and chief executive officer of Hitachi Data Systems Corp. (HDS), Gary Moore had last week that Japanese company, Hitachi Ltd., could be a drawback in dealings with U.S. customers but insisted it is a plus for the company's worldwide image.

As a 17-year veteran of minority-owner Electronic Data Systems Corp. (EDS), Moore said in an interview with Computerworld that HDS (formerly National Advanced Systems) would deal with EDS at "arm's length."

Moore also said the following:

- It is reasonable to expect a high-end CPU to be available within a year.

• The company may start selling new types of peripherals such as disk drives and tape libraries.

• All profits for the first three years will be reinvested and not siphoned off by its owners.

• The public will see a higher profile of the new company.

Hitachi's 80% ownership is

both a blessing and a curse to HDS, which makes IBM 370-compatible architecture mainframes. It is one of two IBM-compatible mainframe vendors, the other being Amdahl Corp., that are more focused on larger-scale systems than

Customers initially said they were pleased because Hitachi was seen as having the deep pockets that former owner National Semiconductor Corp. lacked. Moore said the firm had been profitable for 19 of the last 20 quarters but that National Semiconductor absorbed much of the profit. He added that HDS has revenue of about \$900 million per year.

Some customers are beginning to say that they resent increasing Japanese ownership of America's business, particularly in the wake of Sooy Corp.'s acquisition of Columbia Pictures Entertainment, Inc. and Mitsubishi Estate's purchase of Rockefeller Group, Inc. Hitachi has always supplied Japanese-made

hardware to the company, except for peripherals made in Oklahoma.

"I don't want to appear to be resurrecting deep prejudices and World War II, but I think [HDS] is rubbing our noses in [the Japanese]

business by insisting that Japanese style has no effect on the way the firm is run." We argue that. We don't consider it a bad boy and drink tea, where everything is prearranged," he said. "We're not trying to hide the fact that we're owned by a Japanese company. We also understand that in some corners there's some negativity to that."

Moore is trying to distance himself from his EDS background: "I was on the technical side of EDS almost all of my career, not in selling." He said that while he missed EDS and was loyal to it, he "started over" with HDS.

However, noted Bob Djordjevic, president of Annex Research, a Phoenix-based consulting firm: "It's unreasonable to forget all the experience you had before."

As National Advanced Systems, the firm was soundly criticized for its lack of marketing skills. One of the most vocal critics was Djordjevic, who said he cannot yet pronounce judgment

on HDS' marketing effort.

Moore has brought in an IBM veteran, James Baloween, to head marketing, and has done some consolidating.

"What marketing did exist was fragmented between three to four groups that didn't talk to each other. [For example], they would release products in Germany with a different MIPS rating," Moore said.

Deeper pockets

Hitachi's deep pockets are a technical improvement for HDS. While National Advanced Systems may have had advanced engineering projects, "they were used to having [funding] taken away from them" under National Semiconductor, Moore said.

HDS, on the other hand, spent \$3 billion per year in research and development, the majority of which goes into computer products, Moore said.

Moore said that with Hitachi's hardware, such as optical channels and "nanosecond" wires, HDS can accommodate future mainframe needs, including transferring images and managing enormous databases. Those things are now constrained in software, he said, and his company has to wait for IBM-compatible software to emerge.

Kendall

FROM PAGE 1

members to the business units. At the same time, he implemented a downscaling strategy that ended the reign of the corporate culture and instead focused it with a network of IBM Application Systems/400s.

It appears Cipolla so successfully followed the corporate mandate for decentralization that he put himself out of a job. Earlier this year, it became apparent that the bulk of Cipolla's work on this project was done. However, when the questions arose of where Cipolla would go from there and how he would be rewarded for his effort, there were no easy answers.

Cipolla, it seems, hit the end of the line at Kendall. According to Khan, there is little chance for an IS executive at Kendall to move into the executive suite. "It would be a highly unlikely situation for a IS executive to move to a vice-presidentcy and then to the CEO's position," Khan said.

As Cipolla tells it, he found himself with time on his hands earlier this year and presented the idea of forming Kendall to management. Khan said Cipolla first asked management to allow corporate IS to function as a profit-and-loss center within Kendall, but management did not want to get into the technical services business.

People within Kendall think Cipolla gets a "sweetheart deal,"

according to Khan, because management supported him on his Kendall proposal. Although Kendall did not financially back Kendall, it gave the new company its first big contract and has loaned it an AS/400 and 10 personal computers for one year.

But Khan defends the help Kendall will give Kendall, saying that it made financial sense. Kendall would not only fit with its decentralization strategy, but it would also save it a substantial amount of money. Khan said eliminating the corporate IS function will save Kendall \$500,000 in annual salaries.

Part-time only

"The decentralization was basically complete, so we had a corporate MIS staff with a lot of technical knowledge that wasn't required full-time in the company," Khan said.

"It's very difficult to have a corporate IS car in that environment, because then a CEO or a division doesn't really have command of all the resources needed to run a business," Cipolla explained.

Meanwhile, Kendall is moving ahead with a plan that relies on divisional IS directors for day-to-day operations and outside sources for expertise on particular technical projects.

In addition, an advisory council, made up of these IS directors and outside consultants as well as Kendall's top financial executives, was formed two weeks ago to coordinate the efforts of inside

IS directors and outside consultants and make decisions on long-range IS strategies.

Kendall will use Cipolla's new firm on a per-project basis. For the near future, however, Kendall will provide the services that the firm's in-house staff members are providing on the latest AS/400s.

Kendall will participate in the Kendall advisory council, as will IBM and other outside consultants on which Kendall is increasingly relying. IBM, for instance, was recently selected to manage Kendall's corporate-wide AS/400 network. It also works closely with Coopers & Lybrand on IS management and implementation issues.

"What we see is a trend in business that companies can't have and be everything," Khan said. "We're seeing more alliances with outsiders as opposed to doing everything yourself."

Kendall is in the situation of a complete corporate IS staff has been in the works for some time. When the company first selected the business units as stand-alone profit-and-loss centers, it moved groups of corporate IS employees out to the different locations to support them. That left behind a core IS group that was referred to as corporate IS but had actually taken on the role of directing special projects, such as downsizing to AS/400s.

With the networked minicomputers in place, the corporate group found itself in a more passive role of overseeing systems that were up and running.

Proteon proves token-ring can run on unshielded wire

BY JOANIE M. WEIXLER
CHICAGO

HOUSTON — IBM said it couldn't be done, but Proteon, Inc. claims to have proven that token-ring networks can indeed run over unshielded twisted-pair wiring at 16Mbps/sec.

In a series of product unveilings last week that included the industry's first token-ring adapter for the 32-bit Extended Industry Standard Architecture (EISA) bus, Proteon announced support of 16Mbps/sec token-ring on unshielded wire. The IEEE 802.5 standard specifies the more expensive, but better-protected shielded twisted-pair cabling for token-ring.

Proteon also introduced an IBM Personal Computer AT unshielded twisted-pair adapter, a media filter allowing IBM Micro Channel Architecture computers to run on unshielded twisted pair and Tokenring Plus physical-layer network management software.

Solving the dilemmas

"Proteon was able to drive a signal through more hostile environments at the prescribed distance of 85 meters, which other people haven't been able to do yet," said Doug Gold, director of local-area network research at International Data Corp. in Pra-

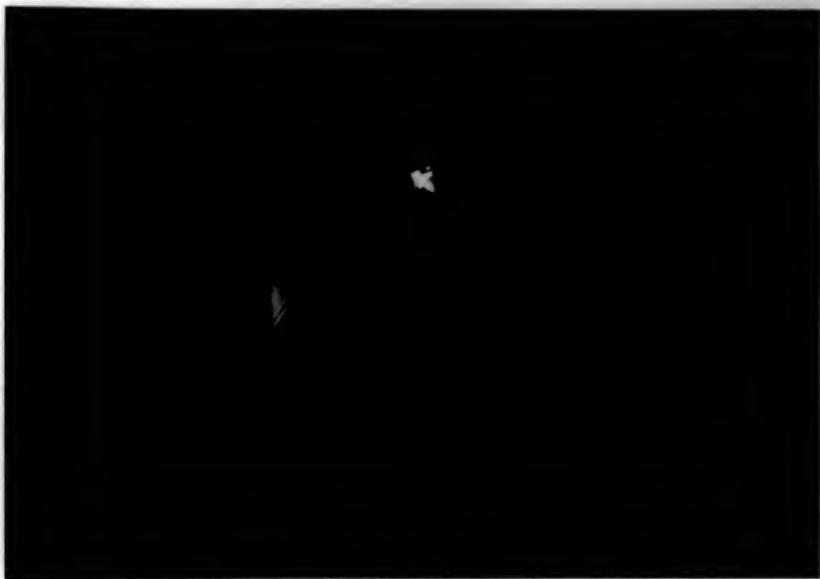

marathon, Mass.

The Proteon announcement should "send IBM back to the lab" to engineer the same capability, according to Mary Donald, an analyst at Cambridge, Mass.-based Forrester Research, Inc. She explained that IBM's skepticism toward 16Mbps token-ring over unshielded wire has been because the interference problems could cause large signaling distortions at the higher speeds.

The network management offering is part of a two-tiered approach in which Tokenring Plus "element managers" monitor physical characteristics of individual token-rings, such as port traffic. Individual token-rings can be collectively managed by Tokenring Manager.

Proteon's \$995 EISA adapter supports Banyan Systems, Inc. Virtual Networking Software (Vines), Microsoft Corp. OS/2 LAN Manager, Novell, Inc. Network 2.15 and IBM Networking Software. The IBM PC AT card is \$995. Both the EISA and AT adapters will be available in volume during the first quarter of 1990, along with the \$995 Tokenring Plus and the \$1,995 Tokenring Manager. The \$200 media filter is scheduled to ship in February 1990.

4th Generation technology finally reaches the data center.

Software AG announces the Data Center Management Series.

If you're tired of managing your high-tech data center with low-tech, antiquated tools, you need the Data Center Management Series™ from Software AG.

Why consider 4th Generation technology for data center management? Because you need it. You need powerful, integrated software to automate the three key areas of your data center:

- Job preparation/scheduling
- Console management
- Network control

Together, NATURAL OPERATIONS, NATURAL CONSOLE, and NATURAL NETWORK deliver advanced solutions for each of these areas.

More importantly, all Software AG technology works together, within one coherent architecture (ISA: The open, Integrated Software Architecture). This integration maximizes productivity, minimizes training time, and increases the overall performance of your data center.

And that's just the beginning of what integrated, 4th Generation technology can do to automate data center management.

The Data Center Management Series. From the world's leading software manufacturer: Software AG.

There's a new player in the data center: Software AG's Data Center Management Series provides a 4th Generation approach to data center automation. For more information, call toll-free: 1-800-843-9534.

 **SOFTWARE AG**
PROGRAMMING BUSINESS SUCCESS

The Data Center Series can either stand alone, or be used with Software AG's ADABAS DBMS and NATURAL 4th Generation application development technologies.

Informix is the #1 And the only

To develop your application faster, you need a 4GL that doesn't rely on COBOL or C to fill in the missing pieces.

INFORMIX-4GL.

A complete COBOL replacement.

Unlike other DBMS products, INFORMIX-4GL is a complete application development language for SQL databases. It's the only 4GL with full screen-building, report-writing and SQL database I/O capabilities designed into a single programming language. Which means it's a real COBOL replacement-caliber tool. So you'll rarely have to revert to COBOL or C to customize an application.

10 times faster than COBOL.
3 times faster than any other 4GL.

When you leave COBOL and C behind, high productivity kicks in. In fact, with INFORMIX-4GL, you'll be able to deliver even the most complex custom applications at least 10 times

faster than you can with COBOL or C. And 3 times faster than with any other 4GL.

Moreover, application debugging and maintenance are a breeze with our INFORMIX-4GL Interactive Debugger. You can view and debug your 4GL source code while the program runs. Even maintenance time will be reduced drastically.

After all, with the non-procedural syntax there's less code to maintain. And the debugger makes it easy for others to understand and maintain your code.

What's more, our INFORMIX-4GL Rapid Development

*Here's what it takes to make a complete 4GL.
And only Informix has it all.*

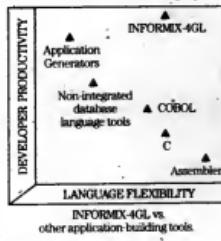

- Complete report-writing screen-building and database I/O language in a single product.
- Language comprised of non-procedural statements.
- Language flexibility equal to COBOL or C.
- Full SQL implementation.
- Application portability without recompiling*
- Complete source code debugger capability.
- A 10 to 1 increase in developer productivity.

Database in UNIX. complete 4GL.

System lets you compile your code in a fraction of the time you'd normally take. And you can port your applications to other operating systems without rewriting or recompiling a single line of a 4GL code.*

INFORMIX-4GL is as flexible as conventional languages, but provides all the power of a 4GL with its non-procedural syntax for handling menus, forms, reports and SQL.

Plus it's more portable.

You can take INFORMIX-4GL just about anywhere—MS-DOS, OS/2, VMS, and, of

course, most every known version of UNIX. Better yet, it runs on more machines (over 200) from more manufacturers (85) than any other DBMS.

All that and a best-seller, too.

Informix DBMS products for UNIX, including INFORMIX-4GL, outsell their closest competitors by a substantial margin. So if you subscribe to the theory that there is safety in numbers, rest assured. With INFORMIX-4GL, the numbers are on your side.

Free booklet,
"How To Choose A 4GL."

For a free copy of our new guide, "How To Choose A 4GL," call or write Informix Software, Inc., 4100 Bohannon Drive, Menlo Park, CA 94025. (415) 322-4100.

And solve the 4GL puzzle. Completely.

INFORMIX

*1 for good reason.

*Obviously, most 4GL programs are code written to take advantage of specific operating system features may need to be rewritten or recompiled.

AT&T to drive Hertz service

BY ELLIS BOOKER
CW STAFF

OKLAHOMA CITY — Hertz Corp. contracted with AT&T last week for packet switches and network management software to help the car rental firm

consolidate its nationwide, multivendor reservation system.

A backbone network of AT&T packet switches "allows us to deploy a single, common corporate network that will meet all of our protocol requirements," said Gary Orrell, staff

vice-president of MIS at Hertz, which declined to specify the amount of the five-year contract.

The contract calls for AT&T to provide an unspecified number of Dataskit II Virtual Circuit switches to tie together an existing hodgepodge of networks.

The Hertz ASAP reservation counter automation system, which the company finished deploying earlier this year, currently carries synchronous and asynchronous IBM System Network Architecture (SNA), Unix Corp. Uniscope and X.25 packet data traffic to a data center here.

Hertz uses IBM Netview to manage and monitor 3270-type

terminals on the SNA portion of the network. The introduction of AT&T's network management products, specifically, Starkeeper Network Management System and Accumaster Consolidated Workstations — will complement Netview but not replace it, Orrell said.

Just how Netview will be integrated with Starkeeper and Accumaster, two components of AT&T's Unified Network Management Architecture, has to be worked out, however. But the concept of a single, integrated workstation for network management "was a driving force behind this decision," Orrell said.

This Software Can Organize Your Files, No Matter What Shape They're In.

No matter how you store your important documents, 3M Document Management Software (DMS) can help you manage those files more efficiently. Because unlike some automated filing systems, DMS can process paper, microfilm and digital files. And it will work even if you store your documents in more than one medium. Or convert from one storage medium to another. So you can plan for changes in your storage media more easily.

Another major benefit of 3M's DMS is that it makes efficient use of computer system resources. It does this by linking all related documents to a

Master Record, which allows you to access files fast. DMS is also easy to install and implement. And simple to learn and use, because 3M tailors the software to your individual application.

3M has already installed DMS applications specifically tailored for Banking, Insurance, Manufacturing, and Accounting. And it's one of the only document management systems that will work with PC, Mini and Mainframe environments. So what are you waiting for? Start getting your filing system in shape today by calling the 3M Information Systems Group at 1-800-247-8316.

BY J. A. SAVAGE
CW STAFF

SUNNYVALE, Calif. — Stepping out of its role as an IBM plug-compatible manufacturer, Amdahl Corp. last week announced two low-end mainframes to run on the Unix operating system.

The one- and two-processor computers can operate on Amdahl's UT5 version of AT&T's Unix System V, Release 3.1. AT&T announced Release 4.0 earlier this month. Amdahl Vice-President of Unix Systems Bill Ferone said his company could not catch up to the newest release until sometime after 1990.

Amdahl has offered UT5 on its standard IBM-compatible mainframes for eight years.

"If people are willing to shy away from Big Blue, they'll get hardware that's competitively priced," said David Card, an analyst at International Data Corp. in Framingham, Mass.

Bob Djurdjevic, president of Annex Research, in Phoenix-based consultancy, said it makes sense to offer an IBM system that can access IBM 370 architecture storage peripherals. "IBM's software price increases will get users to say, 'Enough already,' and they'll want to develop new applications on something else," Djurdjevic said.

Set for availability in January 1990, the 7300 series processors are based on an 18-month-old computer from Fujitsu Ltd., which owns part of Amdahl.

Ferone said that the computers could run Ultrix, Digital Equipment Corp.'s version of Unix. "It's an easy recompile," he said. Amdahl will develop tools to migrate from DEC's VMS to UT5.

The single-processor 7300-150 price begins at \$730,000; the dual-processor 7300-250 begins at \$1.25 million.

Who Can Deliver Private Network Control With Fractional T-1 Right Now?

**X

H**

ONLY GDC CAN.

The networking technology of the 1990's is available right now from GDC. Which means that our customers are taking advantage today of the limitless interconnectivity and lower tariffs of Fractional T-1 (FT-1) while maintaining private network control.

We have been implementing FT-1 networks for our international customers since 1985. Based on this experience we designed FT-1 into our MEGAMUX Transport Management System (TMS).

MEGAMUX TMS embeds network intelligence into each DSO. For the first time you have the flexibility to configure, reconfigure and control individual DSO's - while maintaining network management integrity. As a result, we can provide you with the highest level of FT-1 functionality and network management control. Right now!

And you don't need complex external cabling or equipment to achieve this performance. This saves you a lot of time, money and installation headaches.

To ensure that you always maintain control, GDC utilizes an exclusive centrally weighted network management architecture providing global knowledge of the network from a single point. Redundant control can also be implemented to distribute visibility and control around the network.

And because true network management goes beyond backbone architecture, we provide all the products you need to manage your network from desktop-to-desktop.

To find out more about the numerous advantages of a GDC FT-1 network, call or write for our free video. When it comes to offering FT-1 with the most functionality and control, Only GDC Can.

Call 1-800-777-4005, General DataComm, Middlebury, CT 06732-1299.

At last. A new Laser for you.

**At only \$1495, it's got "personal"
written all over it.**

The HP LaserJet printer family has expanded—in a small way.

The new HP LaserJet IIP (as in Personal) fits on a desk. And, with a price almost half of the multi-user LaserJet Series II,^{*} into most budgets.

Yet it's fully compatible with virtually all popular PC software and the LaserJet Series II. It has the same 300 dpi resolution. And carries on the family's reputation as the most reliable laser printers on the market.

*Suggested U.S. list prices:
LaserJet IIP \$1495;
LaserJet Series II \$2995.
Dealer prices vary.

The new HP LaserJet IIIP printer.

The LaserJet IIP was designed to be easy for any PC user. The simple front panel provides push-button control over the menu, the 14 internal fonts, form feed and other functions. It handles four different paper sizes: letter, legal, executive and A4, as well as envelopes. In portrait or landscape configurations. At four pages a

minute. From one or two paper bins (the second is optional).

The 512K standard memory is upgradable to 4.5 Mbytes for more complex graphics and publishing programs.

So call 1-800-752-0900,

Ext. 277J for your nearest authorized HP dealer. Then introduce people at your company to their very own HP LaserJet printers.

There is a better way.

Risk of infection

ONE YEAR AGO, the computer industry stood still while it tried to sort out the implications of a malicious program that brought down computers on one of the nation's largest data networks. The Internet worm has caused many of us to take a hard look at the fragile slivers of silicon that make many businesses susceptible to sabotage and mischief. Yet little has happened in the past year to prevent a recurrence of the Internet worm.

As we reported last week, the Internet network, which links research institutions around the country, has been subjected to countless security breaches since last November. Viruses have turned up in the computers used by NASA, DEC, Decnet-based government networks and commercial software programs. Users nervously eyed the calendar last month to see if the dreaded Friday the 13th virus would strike. If anything, viral attacks are increasing, and users seem helpless to do much more than back up their data and hope for the best.

Why hasn't the industry been more successful in responding to the virus threat? One reason is complexity. You cannot simply affix a tamper-proof seal to a software program the way you can to a bottle of aspirin. And every time one computer is connected to another, the risk of viral infection exists.

But there is a deeper conflict here. While users are worried about software sabotage, they are also more eager than ever to link their computers in larger and larger networks. How do you weigh the benefits of more sophisticated communications against the admittedly remote risk of a virus infection?

- The fact that the freewheeling Internet has responded so slowly to the threat of a repeat attack shows that to its users, keeping the lines of communication open is more important than implementing clumsy security procedures.

But for others, the spectre of a virus destroying even one record in a mission-critical database is enough to stand their hair on end. They would rather keep users out than risk a single invasion.

Somehow, these two personalities have to find a way to live together in a networked world. As networks proliferate, the number of access points to each computer on the network multiply exponentially. With electronic data interchange and electronic funds transfer becoming a mandate in many businesses, corporations will find themselves with little choice but to open themselves to unknown outsiders.

It would be nice to think that computer sabotage is a twisted fad that will play itself out in time. But that isn't likely. As long as computers present the potential for mischief, there will be hackers equal to the challenge. More alarmingly, organised crime and espionage could become a real threat as the number of networked systems multiplies and the rewards of computer crime increase. Despite the lessons of Internet, we have made little progress toward reaching that delicate balance between ease of access and control, and the questions are only getting more difficult.

LETTERS TO THE EDITOR

Over-kill

The press has reported a grand total of three attacks of the dreaded Friday the 13th "killer virus" you trumpeted so loudly in "Virus outbreaks not so bad, but will get worse" [CW, Oct. 9].

Computerworld has been passing off as fact such claims as "...programmers are trying with one another to see who can write the most destructive virus with the least amount of code." Where did you get such sensitive inside information? Is it wild speculation that someone manufactured to add drama to an otherwise widely overreported story?

What is at stake in the effort to neutralize the threat of computer viruses is the openness of our entire intellectual community. The real target of viruses, whether their creators realize it or not, is the present and future accessibility of all public repositories of knowledge. In a world overrun with viruses, forbidding electronic use of the Library of Congress or our educational facilities becomes a reasonable cause of action.

It has never required genius to shut down networks. Viruses simply allow agents to do it anonymously. Far more challenging is the task of providing security in an open community. The risk represented by viruses, like any other, will be managed poorly if the response inflicts worse deprivation than would the threat itself. We don't need more war stories from your imaginative correspondent in the field. We need accurate assessments of the threat and proposals for developing a rational, appropriate

Hardware survival

Our data center recently survived the Bay Area earthquake despite being located only 12 miles from the quake's epicenter. Our Unisys A-8F mainframe didn't miss a beat with the aid of an uninterruptible power supply unit that provided power purification and backup power.

Unisys deserved accolades for the quality that they have built into their computers and for the service they provided in supervising the construction of our data center. We were able to maintain a smooth operations flow, which is critical during a disaster, when our customers rely on us for the tools and products

Shortly after the quake occurred, Unisys field engineering representatives called to inquire if any support would be required. We appreciate the efforts of the disaster relief team that Unisys flew in to service the remittance processing equipment located outside of the data center. Members of this team quickly had this mechanical equipment back in service.

In short, although San Francisco's Bay Area experienced one of the worst natural disasters since the 1906 quake, Unisys products and services kept

User-driven, or just driving users crazy?

AMY WOHL

To hear computer vendors talk, everything they do is for the user. Having discovered customer requirements, customer feedback and customer satisfaction, even a decision from product design to pricing is justified as "user-driven."

Why is it then that all of these user-driven companies keep making decisions that drive users crazy?

Part of this is simply the price of progress. If you want newer, more powerful personal computers and workstations, they're likely to cost more than older, less powerful systems.

The problem is at once more complex and more simple. Vendors are driven by a set of contradictory principles. They exist not to serve humanity but to make money. And that's all right, because by making money they furnish useful research that would otherwise go unused. Out of all this comes a mix of marginally useful stuff and an occasionally brilliant breakthrough.

Companies crave immortality. And if to stand still is to fall subtly backwards, then companies are fated to always strive for forward motion — to grow, to have a bigger market share, to create and dominate new markets. Customers may find good things to buy and use, but to pretend that these things would be created without the firm's eternal need for growth seems naive.

Users are driven by a somewhat different set of needs and goals. Often, individuals in giant organizations are only dimly aware of the larger organizational aims.

As computer buyers, users strive to meet individual and organizational business needs. This means their focus is on solving problems. Since problems are rarely identified before they become critical, solutions can rarely be sought or implemented in a leisurely fashion.

So the collision occurs because of the differing goals of users and vendors — and because both are always in a hurry. The interesting thing is that user and vendor goals are not at all mutually exclusive. Users want to be able to select from a rich variety of proven solutions. They want the hardware platforms they buy to be flexible and nearly infinitely extensible.

New technology is not a marketing demon, invented by vendors to seduce users. Users want new technology, but they also need this new technology to

come as a graceful evolution from current investments rather than as a plunge off a tall and icy mountain peak.

Vendors welcome new technology because it is in the change from the domination of one marketing opportunity that new opportunities are found. Of course, vendors that are not aligned with the older technology cling to it as long as they can, certain that their marketing success is tied to its ongoing existence. However, there is another side to every coin.

- Users want products to support their specific problems in a highly focused and useful way. But users don't want to invest in customizing generic products. Vendors can't make money building thousands of individually designed, customer-specific products — and customers would probably want them to be changed "just a little bit" anyway. Users need to understand that if it's a worth doing, it's a worth paying for the doing.

- Users want a competitive marketplace in which multiple vendors offer a range of products at reasonable prices. But this kind of competition usually ensures that products will be identical. Then users complain that there is lack of compatibility, decreasing the value of the products they buy.

- Big vendors hate institutional standards; they're hoping that they can establish their own products as de facto standards and establish substantial market control. Small vendors need standards in order to establish an orderly market. Can this orderly procedure happen? In other words, can we let someone else be very successful only in the market in order to establish some mini-ma de facto standard and then let the market proceed and competition enter? Don't worry, we'll never agree on how to let this happen!

- I have a radical proposal: Let us agree that it's all right for vendors to make money. Users who befriend their suppliers a fair profit are simply cutting off their own noses and spitting their future faces. Where will we get new products if such commerce is not a money-making proposition? And let us agree that vendors who offer raw technology — however exciting — and assume that the user will figure out what to do with it are offering us no real service at all. Products are only useful when they solve user problems.

Interweaving IS and business

G. M. K. HUGHES

Information systems clearly believes itself to be in a crisis. What other profession feels so dispensable that one of its top three concerns is the education of senior management?

"I'd like to set up an appointment to educate you" sounds like a suicidal telephone call to me. It is clearly important for the strategic health of contemporary business and IS organizations that senior management have a full appreciation of the benefits to be derived from information technology. But to achieve that goal, IS is better off forgetting the phone call to senior management and focusing on integrating IS with the business.

Some IS leaders seem to think this IS happens by suddenly being invited to participate in planning sessions from which they were previously excluded. A more satisfactory and more permanent solution lies in directly incorporating IS into the fabric of the business.

Says one IS chief, "The trouble is that my people don't understand the business." What should he do? In the long haul, he should hire different people and alter the climate. It is not logical to hire computer specialists who are turned on by optimizing the performance of some computer behemoth and expect them to enjoy helping computer novices increase their insights about the business.

So instead hiring business majors with strong interest and training in information systems. If hiring the right people is the first step, then physical placement is next. You can't expect IS professionals to emote the business goals of an organization if they do not sit or eat lunch with the business folk.

One observes the opposite of this when the information people all sit together at a corporate data center. One can even observe cases where the "application people" are in physical proximity to neither IS management nor business management, thereby ensuring maximum isolation.

Of course, every other staff group who wants a piece of the action has some argument in favor of being located at the hub. And every IS manager will be torn between having the IS staff within the compound and being in the outposts. But they must remember that outposts are

prone to enemy attack, secession or having prisoners taken.

Beyond territorial disputes, there's the question of who interacts with the business managers. One of the worst features of the traditional data processing organization, with its large, grand-design projects, was that those at the bottom of the pyramid never spoke to clients, and only a few of the others were let out without a license.

Alternatively, there were the cast-of-thousands meetings that had all the potential for commu-

nicate what language do they use — their own or plain English? Do they know any verb other than implement, or any noun beyond environment? Environment was what James Watt mismanaged. Our chief executive officer is also a physician to whom an "application" is either an entreaty for a mortgage or a skin ointment. If IS wants to join business, it literally better speak the same language.

If the head of IS speaks nothing but computerese, he is not a candidate for chief information officer. If he speaks the jargon of the business world, or plain English, then he must insist on all his troops doing the same.

So far we have the right people, in the right location, speaking the right language, and nature will take its course. But not totally, for a single IS professional may only get his arms around a relatively small portion of the business. How do you learn more about the business?

What, for example, do IS professionals read? Is it only IS magazines and journals? Every business has its professional journals and trade magazines, but often one can search in vain for an IS name on the circulation list. And what external meetings are the IS people encouraged to attend, beyond user groups and computer trade shows? Are the IS people encouraged to go to shows at which their own organization exhibits? What better place to see how the competition is using information than at the relevant industry shows?

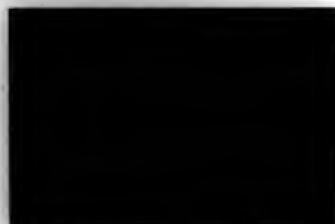

How many IS people have been asked to make a sales call? Is it impossible for those engaged in marketing and sales of systems to meet a customer? If this is impossible, then general management should not be surprised if the "computer people" are off in left field and the head of IS becomes the ignoramus of people about the business.

If the corporate culture doesn't support external travel, what about internal exposure? Do the IS people get invited to the annual marketing managers' meeting, the quarterly controller's gathering? Do the IS people ever get asked to speak at those meetings? If they don't, then IS had better have the business folks over first.

Educating senior management about IS is still a crucial issue, but the most useful way of integrating business and IS is to integrate the people.

TALK

Robert Moran

Down but not out

We are at the end of a decade. The future is promising; the present, anxious; and the past, apparently meaningless.

Although doomsayers must wait another 10 years before tradition tolerates their century-end howlers, modern technology has gotten the signs and ciphers off disk. They must make themselves known.

Fourth-generation language (4GL) developers, or rather vendors, say they will grind their heels in the face of Cobol — already down, winded by its own weight.

However, Marc Sokol, executive vice-president of Reaha, Inc., has argued — and I think convincingly — that 4GLs and their proponents have yet to deliver the goods.

They are fast, the 4GLs.

VMS makes the 9000 upgrade

ANALYSIS

BY MARYFRAN JOHNSON
CW STAFF

MAYNARD, Mass. — The recent debut of Digital Equipment Corp.'s mainframe VAX 9000 told only half the story.

The true test of a mainframe heavyweight lies in its operating system — the engine that drives the box.

In introducing the VAX 9000 late last month, DEC President Ken Olsen acknowledged that fact when he called the VMS operating system "the heart and soul of DEC aspiration."

That heart and soul are still in the shop, however.

The delay between the fall unveiling and spring shipment of the mainframe VAX is caused mainly by tinkering needed to enhance the new unnamed ver-

sion of the VMS operating system, Prudential-Bache Securities, Inc. analysts noted last week. When the new system software appears, it will be "just another release" of VMS, company officials stress, although they expect it to be able to turn a 10-hour job into a 4-hour task.

Feeling good

"Clearly, the software must live up to the hardware, but I am completely confident that if DEC can pull off the technical innovations in the VMS, it will provide the changes needed for VMS within a reasonable period of time," said David Renaud, director of technical services at Grinnell Mutual Group in Iowa.

To non-VAX customers, this machine gives them the opportunity to buy a mainframe-class system with all the advantages of the Digital VAX envi-

ronment," Renaud said. "One of the largest advantages is the ease of systems management via-a-vis the IBM mainframe."

"What IBM always [criticized

DEC for] was that we didn't have the I/O capabilities to run commercial applications," said Rich Whisman, marketing manager for the 9000. "Now, we've got to bed once and for all that we can do I/O as well as anyone in the industry."

Continued on page 33

Key features

According to analysts, users and DEC, the most significant features expected with the next release of VMS are the following:

- Additional vector-processing features such as Computer Interconnect (CI) load sharing, which allows applications to take advantage of the higher I/O bandwidths of the 9000. If one interconnect is busy, the load can shift to another on the bus.

A Disk Subsystem, which allows users to move data off the disk and into the central processor from 10 different locations at once.

- New on-line transaction processing features, such as embedded in the new operating system. A key feature will be two-phase commit, which allows databases or transactions to be distributed across multiple systems. For example, two-phase commit allows simultaneous, synchronized updating of data that is crucial to stock transactions.

Tape-drive beggars can now be choosy

BY ROSEMARY HAMILTON
CW STAFF

My, how the table has turned for IBM AS/400 tape drive users.

Earlier this year, many users were in a panic because their tape backups were inefficient and running way over schedule. Users were stuck, however, because the IBM tape drive was inadequate, and no third-party offerings were yet available.

However, several third-party suppliers began delivering Application System/400 drives during the summer, and IBM began shipping a much-improved drive, the 3490, just a few weeks ago. As a result, users have gone from zero options to several. Instead of being trapped with a drive that even IBM acknowledged as inadequate, users are now calling the shots as they pick and choose from a host of drives.

"I found the answer, and it's the drive manufactured by Cipher," said James Foster, manager of information systems support at Abbott International Ltd. in Chicago. "There have been a compromise between risk and inconvenience. Now I can do what I have to do. I'm thrilled about it."

Like several other users, Foster was greatly disappointed in the AS/400 tape backup but made do with available drives from IBM. However, when IBM introduced the 3490 last summer, Foster did not like the price tag. Then he heard about a Cipher Data Products, Inc. drive. With a starting price of \$25,000,

the Cipher offering comes in at less than half the cost of the 3490.

"I can't sell someone on a \$60,000 drive," Foster said, referring to the 3490. "The people that give me my approvals would laugh me out of the office."

Joe Voloshin, technical support manager at Adventist Health System West, said he plans to sit tight for a few more months until all the third-party vendors have presented their products.

Earlier this year, Voloshin was running tape backups with IBM 2440 drives on 12 AS/400s. It took him twice as

RC/UPDATE™

The one DB2 Management Tool that will make you a Leader!

Do you need a product that . . .

- Manages the ALTERation of DB2 objects, even those changes not directly supported by DB2?
- Will test and execute embedded SQL in your programs?
- Provides an extended ISPF-like editor for browsing and editing data in DB2 tables?
- Will test SQL statements in batch or online, and produce a full audit trail?
- Has a DB2 Space Calculator for calculating the DASD space requirements for DB2 objects?
- Supports all DB2 V2.1 options, including referential integrity and secondary IDs?
- Provides an interactive facility for copying data between DB2 tables?

Then you are looking for the Expert DB2 Object and Data Management Tool . . .

RC/UPDATE. No other single product contains all of the features that RC/UPDATE does. It is the "thoroughbred" of DB2 utility software, from the best in the business. It leaves the competition at the starting gate.

Call today for more information or a free PRODUCT EVALUATION:

PLATINUM
technology

The DB2 Company™
(312) 428-5000

The leader in DB2
Object and Data Management

1 The NeXT™ Computer System is the first computer in the world (and so far the only) to use read/write/erasable optical storage. While PCs today are typically equipped with Winchester drives that store 20 to 40 MB, a single optical disk can store 256 MB. Plus, it is removable, for portability and added security. This dramatically new technology provides storage that is simultaneously

vast, reliable and cost-effective—a combination unmatched by computers of any size.

2 NeXT has made the power of UNIX® usable by mere mortals. UNIX is the high-performance operating system used by workstations to achieve true multitasking and superior networking. Unfortunately, it has

always been the antithesis of user-friendly. NeXT has given UNIX a revolutionary new interface—one that is both visual and intuitive. Now computer users of every level can instantly wield this tremendous power, with no technical knowledge whatsoever.

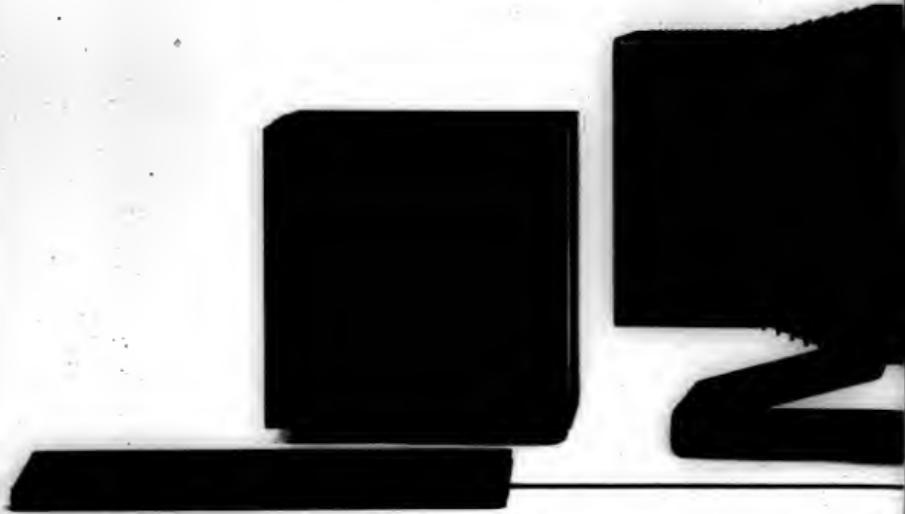

3 To achieve the power needed for the 90s, NeXT bypassed traditional workstation architecture and went directly to that of a mainframe. This eliminates bottlenecks and attains an extraordinary level of system "throughput"—the true measure of computer performance. Only through the use of VLSI (Very Large Scale Integration) technology could this architecture be reduced in size so that it could fit inside a desktop computer. It's a mainframe on two chips.

4 While PostScript® has long been the industry standard for printing, NeXT has made it fast enough to also be used on the display. This "unified imaging model" ensures that what you see on

the display is precisely what you will get on paper. All your work, in any size type and any degree of rotation or magnification, appears with perfect 92-dots-per-inch clarity on the NeXT MegaPixel Display. And with laser precision at 400 dpi on the NeXT Laser Printer.

IN THE 90s, WE'L ONLY TEN REAL BREAKTH HERE ARE SEV

5 The NeXT Computer System is the first to be capable of producing CD-quality sound. Without requiring any additional equipment. This feat is made possible by a chip that has been specifically designed for the task of manipulating sound—the Digital Signal Processor (DSP). Because this processor is standard in every NeXT machine, software developers will be able to call upon its power to enrich programs we use every day. Now computers will not just be seen, but heard.

6 NeXT Mail takes electronic communications beyond anything you've seen on a personal computer before. Now you can send and receive multimedia mail—including text (with varied type fonts, styles and sizes), graphics and voice messages. And despite its high level of sophistication, NeXT Mail is so intuitive, you may never even need to open the manual. NeXT Mail is built into the system, along with Ethernet and TCP/IP, so the NeXT machine can quickly become a part of existing networks.

7 Programmers can create software for the NeXT Computer up to ten times faster than on any other computer—the result of a breakthrough called NextStep. It gives software developers the power to create the graphical user interface portion of their applications (often the most time-consuming and difficult part) without any programming at all. This revolutionary environment means we will see more programs, and better ones, in less time than ever possible before.

These seven breakthroughs will change the way we use computers in the 90s. Which is why Businessland, the leading supplier of computers to corporate America, chose the NeXT Computer System as the workstation they will offer. Call us 800-848-NeXT, and we'll send you a 28-page brochure describing the NeXT Computer. We'll also give you the address of your nearest Businessland Center. There, you can experience for yourself the first seven breakthroughs of the 90s. And get a good idea where the next three will come from.

L PROBABLY SEE ROUGHS IN COMPUTERS. EN OF THEM.

This is Win10's NeXT computer looks like it's
going to Businessland. With great fanfare.

Database helps keep Roadway shipshape

ON SITE

BY ROBERT MORAN
CW STAFF

AKRON, Ohio — Roadway Express, Inc. moves freight, but its subsidiary, Summit Information Systems, moves its information.

Summit, Information Systems, based in Akron, monitors the firm's shipments through an IBM Systems Network Architecture (SNA) network that supports AT&T minicomputers, two IBM 3090s running MVS/XA and its key piece, the Model 204 database management system from Computer Control America (CCA), in Cambridge, Mass.

At its simplest level, the network monitors about 50,000 shipments each day, with many deliveries containing multiple pieces of freight that move in and out of its 33 hub locations and 600 nationwide field locations.

The origin of the pieces

But the process is complicated by the company's method of combining freight based on origin and destination. As the freight and the trucks that haul it are dispatched, sites collect information and monitor the status of each shipment. From point to delivery, each truck travels about 1,000 miles in about four days. Along the way, information about the shipments is keyed into or — using bar codes on its freight control documents — scanned into AT&T minicomputers as freight is combined, broken down and recombed.

"Data needed at any of those facilities may come from or be created at any of the other facilities," said John Pavlik, president of Summit. "We need to manage the data with speed and reliability so the required information can get out to people in our operating facilities in time for them to do what planning and preparation is required to handle their jobs."

The key to the company's shipment monitoring is the Mod-

el 204 relational DBMS, which resides on an IBM 3090 Model 400 and is accessible for testing by a 3090 Model 200.

The Model 400 and the Model 204 database are fed by the company's field locations, which have AT&T Model 3B1s in 400 sites and various-size AT&T Model 3B2s at another 300 sites. "We have a live database that has a history of everything," Pavlik said.

At the local sites, the AT&T minicomputers measure productivity, perform customer service and feed and extract information to and from the database.

The firm keeps its on-line systems running around the clock, with most activity occurring during the night. Running in batch processing on the same machines, the firm has to squeeze it in throughout the day and manage the resource contention.

"The Model 204 has provided us with the ability to handle our volume of transactions in a very short processing time — overnight — and has given us the ability to link together a number of databases into an overall database," said Gerald Long, the company's director of systems development.

The company previously used IBM's IMS database management system and began using the Model 204 against IBM's DB2, which "couldn't handle the transaction rate," Long said. He attributed the Model 204's success to a search algorithm that is structured to retrieve large volumes of data quickly. As a result, the Model 204 serves a strategic role — supporting freight handling and as a feeder to internal applications — and DB2 serves the more traditional support applications, he said.

The company shares files between the Model 204 and DB2. According to Long, CCA is working on a more effective bridge between the systems.

Customers can also monitor the status of shipments through personal computers or the firm's voice-response system, which

Summit's Pavlik utilizes systems that speed freight handling

Pavlik said handles well over one million calls per year.

Using Touch-Tone phones,

customers tap in purchase order or bill of lading numbers and receive a voice response about the

precise trailer, its location and its expected arrival time.

A single bill look-up takes about five seconds — no faster than its older system, Long said. But the older system delivered answers up to eight hours old, while the new system gives the current status of shipments — a direct result of the Model 204's on-line capability, he said.

In addition, the company uses subsets of the shipment database for its internal planning and service analysis. The database also feeds a separate accounts receivable application.

According to Long, the first application for tracking basic shipments took about 10 months to develop, including training time, and was installed in April 1987. The systemwide installation for corporate offices was installed in February 1988.

Graphical user interfaces emerge to vex developers

BY AMY CORTESE
CW STAFF

Graphical user interfaces (GUI) are just now entering the scene, promising to make user-friendly systems a reality.

However, for developers used to character-based terminals, programming for a graphical environment can be a nightmare and consume up to 80% of development resources. Compounding that problem, developers must choose among several GUIs on the market competing for standards status.

It is the classic chicken-and-egg problem, according to Bill Oesberg, director of database development at Unify Corp. While workstations and terminals supporting GUIs are becoming less expensive, there is still no software to take advantage of them.

However, developers are hesitant to invest in a particular GUI at this point for fear they may choose the wrong one. Many point to the dilemmas faced by Lotus Development Corp. as

one example of risk-taking. The maker of 1-2-3 put a major effort into development for IBM's OS/2 platform, only to find that users are content to run Microsoft Windows under DOS.

"They guessed wrong," and they're paying for it now," Oesberg said. "It's just not clear yet what development environment will be the one most people will use."

Meanwhile, software developers are responding with innovative approaches that they hope will make GUI debates irrelevant and speed up delivery of the next generation of graphically oriented applications. One example of how vendors are designing generalized interfaces is Oracle Corp.'s recent announcement that it will support multiple GUIs.

Similarly, Unify provides a tool called Accell CP. A developer can write an application to Accell's presentation interface and run it on any platform that Accell supports. The current release of Accell supports Microsoft Win-

dows as well as character-based presentations, and the company has announced Open Look support for the first quarter of 1990.

Other vendors are moving in the same direction. While he would not comment on specific product plans, Mark Hanner, manager of application development at Ingres Corp., said, "Ultimately, that's the way everyone will go."

However, some users and the current vendor movement may only intensify revolutions, and others still face the decision of which GUI to invest in. Gary Lehr, a staff specialist at DuPont Co., said that such a strategy is "too much of a mainframe approach."

But for large companies that may use many GUIs, these products will make life much easier. Ken Wedg, manager of engineering systems at John Deere & Co., and his firm will use OSF/Motif, Digital Equipment Corp.'s DECwindows, the Apple Computer, Inc. Macintosh user interface and IBM's Microsoft Corp.'s OS/2 Presentation Manager. "Where we're looking for is portability so we don't have to choose," Wedg said. "The whole point of open systems is not to be tied to a particular platform."

Say goodbye to error-prone manual verification and costly rewrites. Let Unitech Systems ensure that your first-run reports are accurate. Our U/ACR automated report balancing software can capture and verify counts, dollar amounts or text from any application—all without program changes or hooks in your MVS or VSE operating system. And we're offering more rule-based solutions, including:

- High-speed matching and reconciliation of transaction records.

- Automatic data set validation before processing.
- Exception reporting and trend analysis of critical production data.

For total information integrity, you can always count on Unitech Systems. Call us at 800/842-3000.

UNITECH SYSTEMS, INC.

RUN IT RIGHT
THE
ST TIME
FOR NUMBERS YOU CAN COUNT ON

We've Gone To Extremes To Give You Just The Terminals You Want.

No matter what you're looking for in a terminal, our new 935 and our 965 are the wisest choices you could make.

Both are extremely reliable, with single-board design and surface mount technology, backed by a one-year limited warranty. Both give you incredibly clear, crisp images, on 14-inch, flat, non-glare screens. And both swivel and tilt, with detached, two-position keyboards for user comfort.

The 935 is the most flexible low cost ASCII terminal available. You get 40 programmable editing keys, 32 programmable function keys, a fully programmable numeric pad, 80 or 132 column display by 24 lines, 2 pages of memory, 9 ASCII emulations. And more.

The 965 is everything you could want in a terminal. ASCII, ANSI, or PC terminal operating modes. 23 terminal emulations. 128 programmable function keys. Up to 7 pages of memory. Multiple display formats up to 49 lines by 132 columns. Interactive on-screen calculator. VideoDesk™ accessories. And more.

For more information fast, call toll-free or write today.
TeleVideo Systems, Inc., 550 East Brokaw Road, P.O. Box 49048,
San Jose, CA 95161-9048.

Because we'll go to extremes to make terminal users,
OEMs and VARs happier.

VMS 9000

CONTINUED FROM PAGE 25

The 9000 hardware and the new version of VMS can combine to increase previous disk access time tenfold from 30 I/O per second to 320 I/O per second, Whitman said.

The new operating system is known in-house as "Actas," after its beta-test site at Aetna Life and Casualty Co. in Hartford, Conn. When all versions of the operating system will not run on the 9000, the 9000's VMS release will run on all previous machines, and users of early versions can upgrade under their maintenance contracts.

There are already some 6,500 VMS applications for VAX systems, and all of them will run on the VAX 9000.

What seems to draw the greatest acclaim for the VAX 9000 system is its increased I/O bandwidth, which helps to position it for transaction processing, high-volume batch processing and other commercial applications.

Vector processors, available for both 6000 and 9000 systems, will accelerate the performance of computing-intensive applications such as seismic analysis and weather modeling from three to 10 times, depending on the application.

"The 9000 gives us the opportunity to grow our Powerhouse-based applications to mainframe-class size without porting to another mainframe," said Harley Shoudice, product marketing manager for Cognos, Inc.'s Powerhouse fourth-generation language.

The raw power of the new mainframe also promises "significant performance

boots," he added. "Conservatively speaking, there will be 10 to 20 times the disk I/O throughput with this new machine."

Applications that are already "tightly integrated" with the VAX architecture are in the best position to benefit from the new features of the 9000's operating system, Shoudice noted.

"The fact that memory capacity is dramatically increased [to 512MB bytes] gives typical time-sharing applications a higher performance rate," Shoudice said.

Another improvement in the operating system comes from placing the internal instruction set in microcode, "which sped up the internal processing," Shoudice said.

Northern Trust Co. in Chicago will consider purchasing a VAX 9000 next year, primarily to run two trust management applications.

The applications, written in the MUMPS language, cannot run in a multi-processor environment and are straining the capacity of Northern's largest VAX 8000, said Robert Tanner, senior vice-president of the trust and financial services business unit at Northern.

The company now has six VAXes in a cluster, making it the largest financial installation of VAX equipment in Chicago, Tanner said.

The IS manager said he would like to have the new release of VMS take charge of disk updating from his primary database to another database established for customer inquiries.

Tanner also struggles with a daily logjam of requests to his database from his largest employee-benefit customers, who sign on to poll off reports that may gobble up 15-20 minutes of the computer's time.

"That is a huge glut of activity for us every day. We're using up almost all the capacity of a 50-plus-MIPS cluster environment," Tanner explained. "In order to keep that activity from deteriorating our response time, I'd rather have that on a separate machine, but with information just as current as the primary database."

A combination of front-end and back-end database management and improved disk shadowing "would give us lot of advantages," he said.

Win a free trip to Communication Networks '90

And get all the details on America's premier communications conference just by entering.

Next February, a major event in voice and data communications will take place in Washington, D.C. In just four days you will be able to gather the latest, most up-to-date information on the fast-changing world of communications at the 12th annual Communication Networks '90.

Afterwards, you'll have over everything from "Interoperability and Connectivity" to "Boundary Issues in Telecommunications." More than 80 conference sessions will bring you up-to-date on subjects like LANs, Network Management, High Band-Width Transmission, ISDN, Standards, Security and Inter-enterprise Networking. And 400 industry-leading exhibitors will give you information about their newest communications products and services.

Selected by the Department of Commerce for the second year in a row to participate in its elite Foreign Buyer program, Communication Networks '90 will give you access to the entire world of voice and data communications technology. As one of the winners of our contest, you could win a free trip to this unique event.

Just send in the form to enter.

When you complete and return the form below, we'll make sure you get complete details on Communication Networks '90 as they become available. AND, we'll automatically enter you in our contest for one of these three prizes:

1. Free air fare, hotel and conference admission. As First Prize winner you will get round-trip airfare from your nearest major airport, three nights at the luxurious Grand Hyatt Hotel, free admission to three days of conferences and the exposition, plus your choice of one day-long, in-depth tutorial. Approximate total value: \$1,375.
2. Free accommodations and conference admission. Second Prize winner will receive three nights accommodations at the Grand Hyatt, plus one in-depth tutorial and free admission to the full conference and exposition. Approximate total value: \$1,375.
3. Free admission to the full conference and exposition. Third Prize winner will receive free admission to the full conference and exposition. Approximate total value: \$1,375.

There's no way you can lose!

Whether you win a prize or not, you win. You will get information on a communications event that can give you an edge over your competition. Send in the form today, or FAX it to 508-872-8237.

Summary of Contest Rules

Entry Form must be filled out with all information requested and received at the address shown NO LATER THAN November 15, 1989. One entry per household/person. No registration is required to enter, but if you win after you have registered, you will receive a full refund. Winners will be chosen at random and announced on December 15th, 1989. Decision of site judges is final. All residents of the continental U.S. and Canada 18 years or older are eligible, except employees of International Data Group, its agencies, affiliates or subsidiaries. Winners must consent to the use of their names and photographs in contests.

For a copy of the complete contest rules, or a list of winners, send a self-addressed stamped envelope to Communication Networks '90, P.O. Box 9171, Framingham, MA 01701.

COMMUNICATION NETWORKS CONFERENCE & EXPOSITION

Taking Networking into the 90's

Washington, D.C. • February 5-8, 1990

Please enter my name in your Communication Networks '90 contest and send me full details about the conference and exposition. I understand I must fill in this form completely in order to be eligible.

Name _____ (please print or type)

This _____

Company _____

Address _____

City _____ State _____ ZIP _____

Telephone (_____) _____

FAX (if available) (_____) _____

List the five communications/networking topics in which you are most interested:

How we helped improve the performance of the new BMW.

There's a sleek new shape on the landscape. A gleaming testament to the fine art of engineering. It's the new North American headquarters of BMW. **ROLM** But like all things BMW, the real power lies under the hood. At the heart of the communications system—the 9751 CBX from ROLM. Why ROLM, of all the systems they could have chosen? It began with a set of expectations. A voice message system that was simple to use. **ROLM** An installation that wasn't a nightmare. Service and support they could count on. All the things they assumed they could get anywhere. But which, surprisingly, only one company had: ROLM. The installation went so smoothly that BMW's normal, efficient operations never hit a bump. **ROLM** On the first day in the new building, every phone had dial tone, every computer display was aglow. Before long, PhoneMail had become an everyday part of doing business, from the board room to the mail room. But even with all this, a feature that wasn't even on their list of expectations turned out to be the clinching factor: ROLM's association with IBM. This combined expertise in voice and data offered benefits no one else could match. **ROLM** Voice/data integration, up-to-the-minute solutions and a solid link for the long term. A long term that includes the technology of Siemens, a world leader in ISDN. These days, there's a new standard of performance at BMW. You'll find it parked on every desk: ROLM. **ROLM**

SOFT NOTES

Andersen adds to Foundation

Andersen Consulting recently extended its Foundation computer-aided software engineering products to include a version for the Bull environment. Foundation for Bull platforms will be generally available in Europe the first quarter of 1990, the firm said.

Transarc Corp., in Pittsburgh, Pa., said its first product, Transarc AFS, a distributed file system for networks of Unix systems, will be available March 1, 1990. AFS incorporates technology developed at Carnegie Mellon University under a joint CMU-IBM project. IBM made an eq-

uity investment in the start-up earlier this year.

Oracle Corp., in conjunction with Pyramid Technology Corp. and Independence Technologies, Inc., recently announced the integration of Version 6 of the Oracle DBMS with ITT Transaction Manager to provide a multithreaded multivendor Unix DBMS for Pyramid's multi-server line of servers. The multitreading capability increases the number of users per server. The product will be jointly marketed by Oracle and ITT, with "limited production release" this month.

Fourgen Software, Inc. in Edmonds, Wash., has signed a marketing agreement with IBM under which IBM will market the firm's accounting applications for IBM's AIX-based systems. The agreement marks IBM's first for AIX-based accounting software, according to Fourgen.

Integrated Computer Solutions, Inc. in Cambridge, Mass., recently began shipping the Open Software Foundation's Motif graphical user interface for Sun Microsystems, Inc., Digital Equipment Corp., Sun and Apple Computer workstations. The firm said it is the first vendor-neutral source for Motif offering the interface for use on various platforms with various software applications.

Moran

CONTINUED FROM PAGE 25

encumbered by the nonstructured methodologies of Cobol development, they permit the end users to program, although the worth of the end users' labor to the enterprise has been immeasurably questionable.

Indeed, the 4GL folks have recognized such and have legitimized touted a crucial benefit of their tools. In the hands of expert developers, 4GLs quickly generate application programs.

Solari argues that these tools only offer programmers a "shorthand for writing applications which fit into certain molds."

Further, the speed often touted for the 4GL is lacking in many of the interpretive 4GLs — a method that examines each line for errors as it is written rather than compiling the program first and examining it second.

To kill Cobol takes time, which can be achieved only with the collective might of standardization.

At present, the programmers and developers skilled in 4GLs cannot rival the number of programmers and developers in the Cobol world.

"The problem can be solved by the development of a 4GL standard or the emergence of one particular 4GL which can be forced to become the standard for multiple platforms," Solari said. "Only then will 4GLs have a large enough base of programmers to rival the staffing situation in the 3GL [Cobol] world."

Such a standard is not likely any time soon. Hence, in my estimation, neither is the likely death of Cobol, which is some 70 billion lines strong, with a wealth of programmers administering to them, to say nothing of the corporations employing them.

Instead, the 4GL proponents are in the anxious stage of the historical curve. Having sketched out plans to prepare their wares for the intricacies of distributed processing, they acknowledge that they will first tinker with their tools to fulfill the requirements of cooperative processing.

A more formally, because they argue, the 4GL embodies IBM's SAA, particularly the common user access's nuances of a common look and feel. The screen management done, they will necessarily preserve the intricacies that differentiate them from their competitors and will have their tools running on any server known to man and exchanging data — transparently — up, down, around and through networks.

Their forces, thus, are scattered, and their real adversaries are not Cobol but the toe-to-toe battles among themselves. In any event, heightened language is neither sharp nor weighty enough to do the deed to Cobol.

Of course, Cobol's death has been forecasted many times, but the collective weight of the Cobol and Cobol Committee, itself not known for speed, has joined an effort to bring object-oriented modeling techniques in object-oriented languages into Cobol. Cobol is an industry organization whose recommendations are often adopted into ANSI standards.

Other issues notwithstanding, if the effort proves successful this month, its weight will help to keep the 4GLs in their niche.

FLEXIBLE • RELIABLE • EXPANDABLE

Direct Channel Attached Protocol Converter/Controllers
From JDS MICROPROCESSING

Direct channel attached HYDRA communication products provide superior flexibility. They allow local or remote PCs, ASCII terminals, ASCII printers, and many other ASCII devices to communicate with mainframe applications. Users can directly access on mainframe databases and electronic mail, check on mainframe operations, transfer files and retrieve reports. And, regardless of the application, you can feel secure. Multi-level password security, positive log-off security, and call-back security can be custom configured to suit your requirements.

More than ten thousand ASCII devices located in large and small data processing centers depend on the reliability that JDS products provide. Transportation, financial, manufacturing, retailing, engineering, government and educational institutions are among various industries that rely on channel-

attached HYDRA products for their ASCII connectivity solution.

Besides all, JDS products expand to meet the demands of your connectivity needs. Support for as few as four ASCII devices or as many as 64 ASCII devices per HYDRA is available. As your company grows, you can upgrade any model to support up to 64 devices and then attach multiple HYDRAs.

JDS MicroProcessing's line of HYDRA products attach to IBM and compatible 43XX/30XX and 9370 CPUs. To discover more about JDS MicroProcessing products, call 800-55-HYDRA. In California calling (714) 778-2263.

End users see fruit of Sybase link

BY JEAN S. BOZMAN
CWT STAFF

BURLINGAME, Calif. — Sybase, Inc.'s new Open Server architecture [CW, Oct. 9], is designed to link Sybase Release 4.0 with database management systems made by other vendors, beginning to ship to end users.

Versions for Sun Microsystems, Inc., and Digital Equipment Corp. systems began shipping last month, Sybase executives said recently.

Looking beyond that, Sybase managers previewed some future features, many of which will not be available until mid-1990 or later. Speaking at an October Sybase users' meeting here, the executives outlined the pending product enhancements to appear probably by 4Q00 users.

In addition to some of the same features were also discussed with Sybase's European subsidiaries and European distributors when Sybase executives later visited Paris.

An OS/2 version of the Open Server is expected to be re-

leased hardware platforms," Epstein said. "We wanted to piggyback somebody's DBMS to all the platforms, and that's what we're doing with Sybase."

Artssoft has programmed Open Server to read data in a number of relational DBMSs belonging to different ticketing

services. The advantage of this approach is that no users are locked out as multiple queries are made and that updates are broadcast throughout the network.

Like Artssoft, many new Sybase users are often second-time RDBMS buyers, said Sybase

founder Bob Epstein, who is now executive vice-president. That means marketing must be aimed at Sybase's ease of use compared with DBMSs made by competitor Oracle Corp. and Relational Technology, Inc. Sybase claims to have at least 1,000 Sybase sites worldwide.

However, Sybase, with 500 employees and \$15 million in quarterly sales, is just a fraction

of the size of \$600 million competitor Oracle Corp. — and Sybase has yet to make a public stock offering. In order to grow, Sybase is zeroing in on lower-cost local-area networks and workstations and leaving high-end systems to IBM and Oracle.

"We're going after the price-sensitive applications," Epstein explained.

"WITH
KELLY

ACCURACY."

IT DOES TAKE a while for OS/2 technology to be developed. We shared the technology that is under active development with our users, but we have not formally announced those things yet."

RICHARD SCHEFFER
SYBASE

leased in the second quarter of 1990, Sybase managers said. Connectivity between that server and IBM's DB2 is scheduled for later in the year, Sybase sources added.

However, details about these features and others were scarce. "It does take a while for OS/2 technology to be developed," said Sybase director of marketing Richard Scheffer.

"We shared the technology that is under active development with our users, but we have not formally announced those things yet."

Some Sybase users have already begun to push ahead with Open Server applications. Dirk Epperson is the IS director at Artssoft, Inc., an Emeryville, Calif., firm that builds ticketing systems for groups such as the American Conservatory Theatre and the Philadelphia Orchestra. Artssoft is an early-release Open Server user.

"We were spending a lot of time trying to port our third-generation languages to differ-

**IF YOU HAD
THE FORESIGHT
TO BUY NAS,
YOU'RE IN
GOOD
COMPANY.**

INTRODUCING HITACHI DATA SYSTEMS.

You chose National Advanced Systems for our high-performance industry-standard mainframes and storage systems. As a result, you gained the best reliability and service in the business.

You made the smart choice, and you're not alone: NAS has now become Hitachi Data Systems.

That means we're fully backed by Hitachi Limited, a world leader in the design and manufacture of mainframe and storage systems and one of the largest electronics companies in the world.

Together we firmly believe the industry-standard mainframe and storage market needs more than a single large

supplier. It needs a supplier that can combine performance, reliability and service with security and dependability.

So Hitachi Limited — a company of \$48 billion in revenues and \$3 billion in R&D — has put its money, resources and reputation on the line to ensure our success as Hitachi Data Systems.

We're going to make a big difference in your business. Because the smart choice is now the safe choice.

Hitachi Data Systems, 750 Central Expressway, P.O. Box 54996, Santa Clara, CA 95054-0996. Tel (408) 970-1000.

NEW PRODUCTS — SOFTWARE

Training

Computer Systems Research, Inc. has released maintenance updates for courses in its MVS/JES2 System Operation and Problem Resolution series.

Five courses reportedly have been updated to reflect an IBM Enterprise Systems Architecture-level of operation and to achieve currency with IBM MVS Release 2.2. The revisions are forwarded on cassette tape and the reference books are included. The price for the JES2 series is \$8,100, and the MVS Internals are available for \$35,880.

Compilers

Oregon Software, Inc. has introduced a port of its Oregon C++ compiler for Hewlett-Packard's HP9000 Series 300.

The latest implementation is reportedly shipped with a source-level debugger, a complete ANSI C library and a library compatible with the AT&T stream I/O li-

brary for C++. A single-user license will be available for \$1,900.

Oregon Software
Suite 200
6915 Macadam Ave.
Portland, Ore. 97219
503-245-2202

MBP Software and Systems Technology, Inc. has enhanced its Visual Cobol native code compiler program based on the ANSI-85 Cobol standard.

Version 2.0 offers support for Novell, Inc.'s Netware and the IBM Personal Computer Network, the firm said. It is available for the VME, VMEbus, Motorola, Inc. 68000 series-based systems running AT&T's Unix System V or Microsoft Corp.'s Xenix/386 operating sys-

tem. The release also runs on Unisys Corp. systems with CTOS VM or BTOS-II software. The single-user list price is \$1,195. Volume discounts and site licenses are available.

Alameda, Calif. 94501
415-769-5333

HCR Corp., which in June 1989 announced a packaged C++ compiler based on AT&T's Unix System V Release 2.0, has unveiled its HCR/C++ for The Santa Cruz Operation's Unix System Version 3.

According to the vendor, the latest release will provide SCO Unix programmers with both compiling and debugging facilities linked with an Intel Corp. 30386-based platform.

The release sells for \$995, with discounts of \$300 per copy available until Dec. 31, the company said.

Computer-aided software engineering

Manager Software Products, Inc. has announced an enhanced release of its Manager Family of Program Products, specifically designed to enable businesses to migrate to IBM's DB2 relational database environment.

The computer-aided software engineering tools are based on the firm's DataMaster Corporate Applications Repository, which automatically interfaces to multiple database systems. The release supports users through all phases of design and implementation of DB2 database applications.

Price depends on the operating system.

Validate DL/1 Pointers Up to 10 Times Faster

You never again have to worry about pointer errors in your image copies. With **POINTER CHECKER PLUS**, a new IMS product from BMC Software, you are assured of accurate data base backups every time. **POINTER CHECKER PLUS** gives you two high-speed options for pointer verification. The Hash Checking Technique takes so little time to run, you can check pointers during a full image copy.

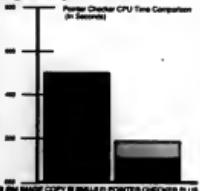

The Full Checking Technique provides an in-depth examination of an existing data base, or an image copy with extensive diagnostic information to help you pinpoint specific pointer errors quicker than with **SMU-COPY**. When **POINTER CHECKER PLUS** runs with BMC's **IMAGE COPY PLUS**, the image copy process with pointer checking is faster than with any other combination available.

BMC is committed to developing new products for IMS, CICS and DB2. A recent *Business Week* study listed BMC first among American companies in the software and services group for dollars spent per employee for research and development. This investment has led to a growing line of high-performance data base utilities, now including **POINTER CHECKER PLUS**.

POINTER CHECKER PLUS increases elapsed time by less than five percent during image copy.

POINTER CHECKER PLUS uses significantly less CPU time.

The products in the series run up to 10 times faster than the IMS utilities they replace, and the list includes:

- **POINTER CHECKER PLUS**
- **IMAGE COPY PLUS**
- **UNLOAD-C PLUS**
- **LOADPLUS**
- **SECONDARY INDEX UTILITY**
- **PREFIX RESOLUTION PLUS**

For more information, or to begin a 30-day Plus Free Trial of **POINTER CHECKER PLUS** or any other product in BMC's Data Base Utilities Series, complete and mail the coupon below, or call BMC Software, Inc., at 1-800-841-2031.

System software

Technical Systems Consultants, Inc. has announced Unixflex, real-time operating system software designed for use with Force Computer's CPU-37 single-board Motorola, Inc. VMEbus computer with integrated Ethernet hardware.

The product is said to be AT&T Unix System V-compatible and is targeted for control and data acquisition system developers.

A command shell, hierarchical file system, editor, assembler and debugger are included.

The single-system licensing price is \$1,000 for Unixflex/RT and \$1,800 for Unixflex/RN with networking.

Ontologic, Inc. has announced Orion, a multilayer object-oriented database program based on the C++ standard object language.

The product is currently available for Sun Microsystems, Inc. and Hewlett-Packard Co.'s Apollo division workstations and offers support for both C++ and SQL, the company said.

The modular software is reported to be especially suited for computer-aided design and computer-aided manufacturing platforms. It can also be used with network management, computer-aided software engineering and office automation applications, the vendor said.

The product costs \$15,000.

Development tools

Unify Corp. has introduced Ac-cell/SQL, a fourth-generation language (4GL) application designed to improve programmer productivity for Oracle Corp.'s Oracle users.

According to the company, the product, which is targeted for Oracle AT&T Unix developers, includes a 4GL as well as an applications generator. It also is said to offer a cooperative processing option that offloads user I/O processing from a Unix host to DOS-based personal computers.

Pricing for the software ranges from \$1,500 to \$140,000, depending on system size and configuration, the firm said.

Template Graphics Software, Inc. has announced the introduction of its PHIGS command interpreter (PCI), a front-end option that is designed for use with Figaro+, the company's PHIGS-based graphics software package.

PCI reportedly allows users to enter and execute Figaro+ commands interactively, with no programming required. Accord-

ing to the company, the product can be used for prototyping, debugging and application development.

It is said to support Digital Equipment Corp., Hewlett-Packard Co., Sun Microsystems, Inc. and various other vendor environments.

Pricing starts at \$750 per copy on a workstation platform, the firm said.

Pride-Tech, Inc. has announced a version of its Life/Health Administration system developed specifically for the IBM Application System/400 series.

Targeted at the life and health insurance market, the software was designed with ANSI-standard Cobol to be fully compliant with IBM's standards for Systems Application Architecture, the company said.

It reportedly will run on all AS/400 models and carries a \$250,000 license fee.

Utilities

Legent Corp. has announced Re-

lease 2.0 of its Multi-Image Manager, a product for sharing resources in multiple-image environments.

The software was designed for sites with two or more physical CPUs running IBM MVS or VM, or sites with CPUs logically partitioned under IBM PR/SM, VM or Amdahl Corp. MDF. It includes an improved user interface and the ability to dynamical-

ly change control parameters. It also offers an alternative communications method between systems via high-speed channel-to-channel devices.

Annual lease pricing is based on CPU class and starts at \$10,900.

Berkshire Software Company has announced Neurislog, a neural network tool that is implemented in Borland International's Turbo Prolog.

According to the company, the product can be used for education and training, research, or exploration, as well as the actual development of neural network applications.

The program employs the back propagation algorithm, and network weights can be stored and retrieved, according to the vendor.

It requires an IBM Personal Computer or compatible, and a single-copy license is priced at \$149.

Emulex Corp. has released two small computer systems interface (SCSI) host adapters created specifically for Digital Equipment Corp. Unibus systems.

The UC17 and UC18 are standard quad-wide modules that offer compatibility with DEC's Digital Storage Architec-

ture, the vendor said. The UC17 is a single controller with one SCSI bus port that supports up to seven SCSI disks or up to ten SCSI tape devices. A single SCSI port can provide more than 14G bytes of unattended backup. The UC17 costs \$1,800.

The dual-controller UC18 in-

corporates two SCSI ports, each operating independently of the other, according to the company. One UC18 can support up to 14 devices, seven tape and seven disk, 14 tape, or 14 disk configurations. The product is priced at \$2,250.

How to decide on a

More than likely, you've seen a few spreadsheets in your day. The problem is, on any given day you might find several in use within your very domain. One for Mac. One for MS-DOS. Even one for MS OS/2.

But what happens when members of the same corporation need to share ideas and information? The only thing they end up sharing is frustration.

Well it doesn't have to be that way. Now, with Microsoft® Excel you can employ one spreadsheet solution throughout the entire corporation. Because the Microsoft Excel family shares the same file structure, macro

language, and most important, interface.

The glue behind all of this is GUI. As you know, the graphical user interface is quickly becoming the industry standard. And that, in turn, means users find Microsoft Excel easy to learn. And therefore, easy to use. They'll be up and running before you know it, sharing files and even macros.

All of which means lower training and support costs for the company—as well as a little

spreadsheet once.

peace and quiet for you.

Beyond the fact that Microsoft Excel is a strategic solution for your company, the plain fact is, users love it. And they're not the only ones. Consider this: Microsoft Excel for Windows won *PC Week's* Poll of Corporate Satisfaction. And it was voted *InfoWorld's* MS-DOS Product of the year.

Not to be outdone, Microsoft Excel for Macintosh® received *InfoWorld's* Mac Product of the Year. And was ranked number one in the *Software Digest* Spreadsheet Review.

Even better, the move to a graphical spreadsheet couldn't be easier. Lotus® 1-2-3®

users can simply upgrade to Microsoft Excel for Windows or OS/2, while Mac users can enhance their spreadsheet experience by upgrading to version 2.2.

To see how other corporations are using Microsoft Excel across multiple platforms, call for a free copy of our White Paper at (800) 541-1261, Dept. K17. And watch something positive spread all over the corporation. Your reputation.

or all.

OS/2® Presentation Manager

Proof that a four-session terminal is more productive than a two-session terminal.

Introducing the IDEA 177. A System 3X or AS/400 terminal that can actually double your productivity by making it possible to perform as many as four tasks at once.

For example, a warehouse supervisor receives an order. With the IDEA 177's two host-addressable printer sessions and two simultaneous display sessions, he or she can check inventory, evaluate a customer's credit, scan the product's serial number with a bar code reader and print shipping documentation all at the same time. On the other hand, an insurance agent might concurrently enter a claim, review prior claims, determine a customer's payment history, then print a letter to the local agent.

The possibilities are limitless. And so are the ways in which

you can configure the IDEA 177. It features full 5219 emulation, and its two printer ports make it possible for you to connect to virtually any PC printer. You can use the serial port to take in data from magnetic stripe or bar code readers, and simultaneously print through the parallel port.

The IDEA 177 presents information in 80 or 132 columns, on your choice of green, amber or color screens.

For more information on the four-session IDEA 177, call 1-800-257-5027. It's one terminal that can really nourish your appetite for greater productivity.

IDEA

The intelligence to do things better.

Digging for the truth

You may have seen the ads, but you shouldn't believe them.

Intel has been spending money hand over fist to run a two-page campaign in trade publications and daily newspapers. The first page features the number "286" with a bold X sprayed over it. The second features a big "386" with the letters "DX" written through it. And the message is, it "doesn't make sense" to buy a personal computer using the 80286 processor; instead, you'll get more at the same price if you opt for a system using the hybrid 386SX chip.

Both Intel and Microsoft Chairman Bill Gates have been singing the same insulting song for the past few weeks: You're a fool if you buy a 286-based system.

Peripheral wait hinders buses

Nonetheless, EISA-related rollouts expected to hit market this month

ANALYSIS

BY RICHARD PASTORE
CW STAFF

What are the wider I/O paths of the 32-bit EISA and Micro Channel machines without peripherals that take advantage of them? About as useful as a newly widened four-lane road to a person riding a scooter, say users and analysts.

A paucity of 32-bit local-area network cards, disk controllers and graphics boards is undermining the power of personal com-

puters based on IBM's Micro Channel Architecture (MCA) and rival Extended Industry Standard Architecture (EISA), observers said.

However, industry experts expect this month to be a big one for peripheral debuts, particularly those that are EISA-related. A few networking devices have already rolled out on the coattails of last week's Compaq Computer Corp. EISA introduction.

Without 32-bit peripherals, users' investments are compromised. "You want to match processor power to peripheral pow-

er to get the most for your dollar," said Bruce Stephenson, an analyst at Farnham, Mass.-based market research firm International Data Corp. "If the system is 32-bit, you're only tapping half its capabilities with 16-bit peripherals."

Users know they need more than just a high-speed processor. "It does me no good to be able to pass data through a CPU at whirlwind speeds and have it sit in a print buffer waiting to print," said Ronald Blystone, director of MIS at Harsco in Camp Hill, Pa.

Baxter Healthcare Corp. is planning to tie its more than 200 LANs to Intel Corp. 1446-based file servers — either MCA or EISA machines. However, a search during the last six months failed to turn up a 32-bit LAN adapter that would optimize the boxes' performance, said Brian Cobble, manager of competitive systems technology.

"We didn't find anything, so we've decided to wait and see what comes out for EISA and the Micro Channel world," Cobble said.

A similar wait-and-see attitude on the part of vendors is one reason why 32-bit peripherals have been slow to make it to market. Some vendors, fearful of siding with either EISA or MCA

Apple finds indirect route to business world

BY JAMES DAILY
CW STAFF

CUPERTINO, Calif. — The terrible teens at Apple Computer, Inc. have begun with a hormonally charged drive to enter the corporate boardrooms — and they have meant drastic action and new growth.

Apple's recent success in securing large contracts with the U.S. Air Force, AT&T Life & Casualty Co., Pacific Bell and other major corporations is a consequence of a war being waged by the Apple Integrated Systems division (AIS), which is making good on the 13-year-old company's long-standing promise to cap-

ture big business contracts that previously seemed beyond its grasp.

Heading up that mental and technical challenge is Vice-President of Customer Service and Information Technology Morris Taradashky, whom Apple snatched from the bulkware of the corporate world — IBM. With 18 years at the industry giant — including three years as general manager of IBM's prestigious Santa Teresa, Calif., laboratory — Taradashky serves as an evangelist with the challenge of convincing the rest of the company that the desktop is the window into the historical information systems glass house.

Apple's Taradashky takes on the challenge of promoting the desktop

"For years, Apple was viewed as a company that simply did not understand the corporate world," Taradashky said in a recent interview. "The perception

of Apple users is that they have this stovepipe mentality, doing their own thing and building their own systems."

With the herd mentality seen as a key ingredient in most corporations, some managers were not comfortable with the idea of a looney-goosey Apple user putting cracks in the foundation. It was up to Taradashky to prove that the two ideals are not mutually exclusive.

"When we say we focus on the individual, we're not describing an independent entity. We're describing a way of computing to get your job done faster," he said.

Taradashky also discovered

Micro Focus brings 370 Assembler to the PC!

The Micro Focus 370 Assembler is a tool which helps maximize the productivity of both the mainframe Assembler programmer as well as the COBOL programmer whose application calls Assembler subroutines.

Micro Focus 370 Assembler allows PC development and maintenance of host based Assembler and mixed COBOL/370 Assembler applications when used with Micro Focus COBOL/2 Workbench. The full featured Assembler programming environment includes:

- Macro Processor
- Assembler
- Linkage Editor
- Run Time Facility
- Interactive Debugging Facility

MICRO FOCUS®

A Better Way of Programming™

- Rapid Macro processing and Assemblies
- Reduced Host dependency and turnaround
- Reduced development time
- Interactive 370 Assembler debugging
- Support for the full IBM 370 and 370 XA instruction set
- Reduced mainframe resource utilization

For more information about the Micro Focus 370 Assembler or about other Micro Focus products call 1-800-872-6265 or 415-856-4161.

When Texas Instruments decided to offer their latest portable solutions, they focused on two things users really wanted in 286-class laptop computers.

Light.

TI introduces the TravelMate™ L
Full-function AT-compatibility, featuring two of the

Model 12: All the power — half the weight.

Weighing a remarkable 6.7 lbs. — including battery and 20 MB hard disk drive — TI's TravelMate LT286 Model 12 delivers all the processing power of a desktop PC in a laptop. It's the perfect choice for professionals who need to work on-the-go.

Getting started couldn't be easier. That's because the Model 12 has MS-DOS 3.3[®] and LAPLINKTM in ROM. It also comes with a preformed disk drive, making it ready to use right out of the box.

With the Model 12, you don't sacrifice performance for small size and weight. Business software runs fast, thanks to a 12 MHz 80286 microprocessor. There's plenty of storage for all kinds of software applications — the internal hard disk drive comes standard. Plus, you get 1 MB of RAM, expandable to 4 MB.

Not only does the Model 12 perform like a desktop PC, it has the same touch. The AT-style keyboard provides full-size, full-sized keys that give your fingers plenty of room.

Other features include an easy-to-read, enhanced Superwair buckle LCD screen. A removable 3.5" high-density diskette drive provides additional flexibility and convenience — snap it on for loading software or remove it and travel light. And, sending critical work to your office takes only a phone call with an internal modem.

The TravelMate LT286 Model 12: the laptop that doesn't compromise performance for size.

Bright.

T286 Series of laptop computers.
the industry's lightest, brightest portable solutions.

Models 25 and 45: Dazzling display for windowing and graphics.

If you want portability and an exceptional display for graphics, you'll appreciate the bright side of this solution. TravelMate T286 Models 25 and 45 feature a brilliant black-on-white VGA display that rivals that of most desktop PCs.

This makes text easy on the eyes and provides crisp, well-defined graphic images for applications that use MS[®] Windows, like Page-Maker[®] and Excel[™]. The VGA screen is perfect for presentations to clients and prospects, plus your own personal use.

Not only do you get a superb display, you get superb performance as well. Like standard AT-compatible desktop PCs, Models 25 and 45 operate with a 12 MHz 80286 microprocessor for quick and powerful processing. You also get a 20 MB or 40 MB internal hard disk drive; an internal 3.5" diskette drive; 64KB of RAM, expandable to 3.64 MB; an AT-style keyboard with full-size, full-travel keys; and an internal battery.

In addition, an intelligent power management system turns off the screen and fixed disk drive during periods of inactivity to extend battery life, allowing you to use the laptop longer.

Considering all these features and the performance and versatility they deliver, why would you ever need a desktop PC?

For computing on-the-desk or on-the-go, it's TravelMate T286 Models 25 and 45, the 286-class laptops that combine might with bright.

Two decades of portable solutions add up to lighter, brighter solutions.

Twenty years ago, TI introduced the world's first portable data terminals. Today, with nearly a million units sold, we've established ourselves as a market leader by offering products that increased

in functionality and decreased in size.

This unparalleled experience has enabled us to provide you with the TravelMate LT286 Series - laptop computers that are powerful, innovative

and durable. Qualities you have come to know and expect from TI. The choice for lighter, brighter portable solutions.

For more information, call TI today 1-800-527-3500.

Bank group excels with Windows

Hemmed in by 1-2-3, some users switch to icon-based spreadsheet

ON SITE

BY PATRICIA KEEFE
CW STAFF

SAN FRANCISCO — Two years ago, a handful of financial analysts at Citicorp's Private Banking Group began hitting the upper limits of Release 2.0 of Lotus' 1-2-3 spreadsheet. Release 3.0, never mind 2.2, was nowhere in sight, yet these power users needed to turbo-charge their desktops — and fast.

The solution, it turned out, was to switch to Microsoft Corp.'s Windows Excel. Not only was it the icon-based spreadsheet

easier to use, but it took advantage of Windows and it has helped to cut down the time required to do reports, said Cathy Vincent, a staff financial analyst.

Vincent concedes she has not seen 1-2-3 Release 3.0, which Lotus finally rolled out several months ago. But in any case, here is a Windows environment now, where Lotus still does not offer a Windows-based version of its popular spreadsheet.

"We've made our decision. After working with [Excel] for two years, it would be too hard to go back [to Lotus]," she said, underscoring recent comments by some Windows users that Lotus is missing opportunities by not

operating under Windows. So, Vincent's group has relegated Lotus to the "not very high-power users," who tend to be marketing people with applications calling for simple spreadsheets. This actually constitutes most of Private Banking Group's 50 employees. "We'll be looking at 2.2 when we're ready."

Only after three or four on the heels of financial analysts have felt the need to move to Windows Excel. These power users write a lot of financial reports that Vincent said call for "more sophisticated capabilities" than 1-2-3 Release 2.0 could provide.

For example, Vincent said

she takes great advantage of Windows' Dynamic Data Exchange to link files and various spreadsheets together — both her own and to other Excel users' spreadsheets.

She does some linking to Microsoft's Word for DOS word processor, but indicated it has problems working with Windows. "You're not pulling down the same menus and seeing the same wording," Vincent explained. As such, although she has seen only a beta-test version of Word for Windows, which was introduced two weeks ago, she will probably migrate: "We're buggering them to it."

Touchless updates
When Word for Windows is linked to Windows Excel, a change in price made in one package can be automatically updated on the spreadsheet without touching the keyboard.

Vincent sees a lot of potential for future integration between Word and Excel under Windows. For example, the new Word for Windows features both the ability to import and integrate a variety of data, images and text as well as hot links to source data

from other Windows applications. The need for such integration is driving her group to further exploration of the idea of purchasing packages from the same developer, she said.

Vincent has also used Windows Excel to automate a quarterly budget report and a monthly financial analysis. "It enables you to create report shells so that you can kick out reports on a monthly basis once you feed in certain data," she said. The time it used to take under Lotus has put to good use, she said.

Some of the work Vincent does can be done under Lotus, but she finds it much easier to do it under Excel. Yet at the time, Vincent did not switch to Windows Excel to use Windows. "We bought it [initially] because of the hard-copy presentation," she said, citing the font selection and the way the package interfaced with laser printers.

Like anything else, Windows Excel does have drawbacks. Vincent runs Windows Excel on a Compaq Computer Corp. 386/S with 4M bytes of extended memory, upgraded from expanded

Ashton-Tate: News of death was exaggerated

BY CHARLES VON SIMSON
CW STAFF

SAN JOSE, Calif. — Ashton-Tate Corp. recently provided some signs of a pulse, proving to many analysts that the company is just sleeping, not dead, as the industry waits for Dbase IV Version 1.1.

The company announced Multimate Version 4.0, as well as a utilities and business graphics package. Ashton-Tate has high hopes that its newest word processing package can jump Multimate from its current sixth-place position — fifth in some market rankings — into third behind leading packages from Microsoft and Wordperfect.

"[Word processing] is a fragmented market, and this market is easier to move up," said David Bayes, software analyst at Montgomery Securities in San Francisco. "But Windows is a major factor, and the announcement of Microsoft Word for Windows

Aiming higher

Ashton-Tate is waiting for a new release of Multimate to move it up in the ranks of word processing packages

still doesn't help [Ashton-Tate's] position."

Microsoft announced that the Windows version of Word would be available in December. That does not help Ashton-Tate's efforts, but most observers agree that Multimate enjoys a large installed base, and any large-scale move to Windows will take several product generations.

In addition, the new version will include several new features. Electronic mail and grammar-checking functions, both acquired from third parties and integrated into the package, are among the most significant.

Even so, Ashton-Tate does make strides with Multimate, however, the product accounts for only about 15% of its total revenue and is not enough to buy the company if Dbase IV Version 1.1 does not float. "The new products are all solid efforts but can only do a limited amount toward getting Tate back on track," Bayer said.

The company also announced Applause II, a business graphics package, and Control Room, a PC utilities package. Most notable about the announcements was the \$95 introductory price of the Applause product, which ultimately will carry a manufacturer's list price of \$495.

"There is no grand scheme to re-price graphics," said Richard Dyn, marketing manager for Applause. "The overall message is that Multimate enjoys a large installed base, and any large-scale move to Windows will take several product generations.

Everex blasts off 21-MIPS RISC Unix workstation

BY JAMES DALY
CW STAFF

FREMONT, Calif. — Everex Systems, Inc. let fly a blast of computational power recently with the rollout of a reduced instruction set computing (RISC) Unix workstation that reportedly can process up to 21 million instructions per second (MIPS).

The Step 8825 also casts another ballot for Motorola, Inc.'s 25-MHz 88000 RISC microprocessor, which powers the Everex.

The RISC architecture optimizes speed by simplifying the computer's internal communications.

Like its predecessor, the 17-MIPS Step 8820, the Step 8825

uses a dual-processor, dual-operating-system setup that employs an Intel Corp. 80386 as a co-processor to service 88000 I/O requests and run MS-DOS applications.

Memory to 2GM bytes

The new model is available in memory configurations of 4M to 20M bytes.

Everex officials said the Step 8825 complies with the Silicon Computer's Binary Compatibility Standard (BCS) for the 88000, assuring compatibility with all BCS-compliant Unix software developed for the 88000.

The machine is available for immediate delivery, with prices starting at \$14,995.

Introducing The NCR PC486/MC.

Every successful team needs a lead player.

Whether the arena is basketball or business.

The lead player in today's PC market is the new NCR PC486/MC, the personal computer designed for the power user.

The NCR PC486/MC sets a new standard in speed, performance, and productivity—combining a 25MHz Intel486™ microprocessor, Micro Channel™ Architecture, 128KB of high-speed cache memory (twice what you find on competitive models), a Small Computer System Interface (SCSI) controller, and SuperVGA graphics are standard.

This is a true multi-tasking personal computer. Ideal for large spreadsheets, extensive database management, financial modeling, artificial intelligence, networking, and more.

Importantly—you also have the choice of MS DOS®, OS/2™, and UNIX® operating systems.

Like all NCR personal computers, the PC486/MC is a team-player, networking

information, applications, and resources quickly and efficiently. So people can make better decisions and work together more productively as a team.

Supporting the superstar PC486/MC are the entry-level PC286 desktop and the ever-powerful PC386. Between them in our lineup are the PC386sx and the PC386sx/MC, two Intel386™SX-based personal computers that deliver significantly improved price/performance capabilities over Intel286™-based PCs.

NCR teamwork goes beyond hardware and software, providing dedicated service and support for a solutions approach always open to individual needs. Because that's the name of the game.

For a free literature packet on this new team of personal computers and the location of the Authorized NCR Reseller or sales representative nearest you, call 1 800 544-3333. Or write to us at P.O. Box 2989, Norcross, Georgia 30091.

'Floptical' puts its heads together

BY RICHARD PASTORE
CW STAFF

A floppy disk drive that crams 20M bytes of data onto a 3½-in. disk may demonstrate the adage that two heads are better than one. Two drive heads, one magnetic and one optical, and spe-

cially prepared disks make possible the 20M-byte capacity of the "Floptical" drives announced recently by Santa Barbara, Calif.-based Manasa Microsystems, Inc.

The optical head reads servo information, or data positioning cues, optically embossed on the

disk by the manufacturer. Because they are optically recorded, the cues are highly precise and take up very little disk space. These factors in turn allow the magnetic head to record data more densely on a larger area of disk surface.

The Manasa/VHD drive,

which can be connected to IBM Personal Computers, XT's, AT's and Intel Corp. 80386-based compatibles, operates at twice the access rate of 1.44M-byte 3½-in. floppy drives, the company said. However, it cannot keep pace with an average hard disk drive, which can seek data at five times the speed.

The most obvious potential users are those needing to back

up 20M-byte hard disks, said Robert Katine, an analyst at research firm Disk/Trend, Inc. in Los Altos, Calif. "They wouldn't have to fool around with the slower tape drives, buy weird cartridges, or lease a new set of software."

Other users who could benefit include those needing to store files measured in multiple megabytes — graphical files in particular, noted David Gluck, Manasa president.

Gluck said pricing for the drive has not been determined, but he said an internal version will cost less than \$1,000, and the external model will be priced higher than the internal. The optically embossed disks, available from the company, carry an OEM price of \$20 each. Manasa licensed the disks and drives for resale from developer Insite Peripherals in San Jose, Calif.

The Manasa/VHD drive will be demonstrated at the Comdex/Fall '89 trade show this week and is expected to ship in the first quarter of next year.

Maintenance and more from Zenith

BY ELLIS BOOKER
CW STAFF

GLENVIEW, Ill. — The U.S. government's largest supplier of general computer systems, Zenith Data Systems (ZDS), has nabbed a seven-year, \$534 million contract to supply several U.S. Defense Department agencies with peripherals, software, training and maintenance services.

The Standard Desktop Computer Companion Contract, awarded last week by the Navy's Automatic Data Processing Selection Office, covers the estimated 500,000 desktop and laptop PCs that ZDS has sold to the government since 1983. The hardware and software support extends over five years, after which the government can continue to receive maintenance, training and support services from ZDS for two years.

ZDS parent Zenith Electronics Corp. last month agreed to sell its computer business, including ZDS, to Group Bull of France, which is largely owned by the French government.

While foreign ownership of ZDS makes the "circumstances of the award a little unusual," according to a Navy spokesman, he added that the U.S. government does not believe this will have a material impact. He noted that ZDS has promised it will continue to be a U.S. company incorporated in Delaware with U.S. manufacturing.

Finally, A 4GL That Can Thrive In Any Corporate Culture.

Regardless of the corporate environment, regardless of the application requirements of the business you're working on, there's one 4GL that always delivers fruitful results.

PROGRESS, truly adaptable 4GL/RDBMS software that organizations like The Damon Company, Sherwin-Williams, and Marriott Corporation rely on for formularies everyday.

A 4GL that's used in fields as diverse as manufacturing, health care, and bond trading. That's why the Datapro ratings of 4GLs two years running (see chart) and one that lets you easily produce reports, perform queries, and print screens.

What's more, PROGRESS comes with automatic crash recovery and ANSI-standard SQL. And because you write everything in our 4GL, you're guaranteed portability across VAX/VMS, MS-DOS, UNIX, CTOS/BTOS, and networks.

So call to test-drive a complete evaluation copy of PROGRESS, and ask about our Demonstration Video.

It's one 4GL that will suit everyone's taste.

That's

Laptop competition heats up

BY SALLY CUSACK
CW STAFF

The battle for heavyweight market share in the lightweight laptop arena has escalated in recent weeks with the introduction of several battery-powered portable personal computers, each weighing in at under 15 pounds.

Tandon Corp. unveiled the company's first two laptop machines. Each incorporates high-definition super-twist LCDs and weighs 14½ pounds.

The LT786, based on Intel Corp.'s 80386 chip, has a 386SX microprocessor operating at either 8 MHz or 16 MHz and uses the low-powered CMOS variant of the Intel chip, the company said.

It includes IBM Video Graphics Array (VGA) capabilities, a 40M-byte hard disk and a 3½-in., 1.44M-byte floppy drive and is priced at \$3,950. Deliveries are scheduled for December.

The firm's LT786 machine reportedly uses the CMOS ver-

sion of the Intel 80286 chip, running at either 8 MHz or 12 MHz. Currently available, it is equipped with a 20M-byte hard disk for \$3,160.

Travelsite Instruments, Inc.'s Travelsite LT7286 series offers a choice of three models. The

25 and 45 tip the scales at 14 pounds each, offering 640 Kbytes of dot-dot VGA capability. The Model 25 features a 20M-byte hard disk drive, the Model 45 a 40M-byte hard disk. Both systems offer 640K bytes of RAM. They cost \$4,999 and \$5,999, respectively.

Rounding out the laptop parade is Toshiba America Information Systems, Inc., which introduced a 5.9-pound portable unit, the T1000SE. The 9.54-MHz system is based on an Intel 80C86 chip and is slated for delivery in January. The suggested price is \$1,699.

In addition, Toshiba introduced a 14.9-pound, 16-MHz based 80386SX-based portable device. The T3100SX is scheduled to ship next month and includes 1M byte of RAM, expandable to 7M bytes in 2M-byte memory increments, or a total of 12M bytes using 4M-byte memory modules. The unit also features a 40M-byte hard disk and carries a price tag of \$5,999.

The 80L286-based Models

IT's Travelsite LT7286 series has three models ranging in weight from 6.7 lbs. to 14 lbs.

MICRO NOTES

Toshiba controller chip ups speed, reduction

Toshiba Corp. has started marketing a new controller chip, the TMP96S301, which reportedly will speed up laser printers, copiers and graphics terminals to reduce the size of their printed circuit boards to about one-tenth of their current size.

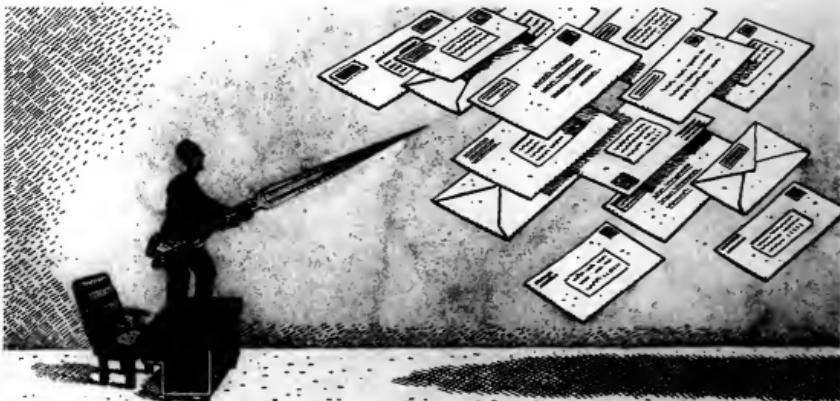

Redgate Communications Corp. is offering a compact disc/read-only memory (CD-ROM) product of its *The Macintosh Product Registry*.

Executive Technologies, Inc. (ETI), developers of CD-ROM retrieval software, said that the U.S. Government Printing Office has purchased 2,300 copies of ETI's Search-Express package. It will be used to produce a CD-ROM disc for the Environmental Protection Agency (EPA), which will be available in 1,400 Federal Depository Libraries nationwide. The EPA will use

another 300 copies, while 600 copies will be offered for sale to the general public.

Oracle Corp. has turned its attention to computer-integrated manufacturing (CIM). The company's Oracle relational database management system will serve as a platform for integrating applications, databases and information in an enterprise-wide CIM strategy. Other components include its integrated families of manufacturing and financial applications and a team of CIM partners, described as developers of Oracle-based engineers or shop-floor applications.

Millennium Software has announced co-marketing agreements with Oracle under which Millennium's Hyper Fusion application development tool will provide Apple Computer, Inc. Macintosh users with direct access to Oracle databases through Oracle's Hypercard interface.

"Our competition promises immediate response. With this system, we've learned not to promise anything."

Anyone can develop a Macintosh-to-IBM mainframe link. On the surface.

It's not particularly difficult to physically connect a Macintosh to an IBM mainframe. The hard part is coming up with a solution that takes the whole process to a much deeper level.

No one knows this better than Avatar.

The fact is, with over seven years of 3270 connectivity experience and a

dedication to Macintosh integration ever since there was a Macintosh, MacMainFrame can offer you advantages nothing else can.

Like software that works exactly the same on every single Macintosh model, from the Mac512Ke to the MacIIcx.

Software designed to cut training costs now and

built with staying power for the future when your system needs become more complex. Both of which can really help you keep things under control.

And where others settle for mere physical connectivity, Avatar gives you performance much deeper than that.

Like true Mac-like

DFT support that lets you run as many as five mainframe sessions at once, and that *PC Week* said, "stands in a class by itself."

Like the ability to customize applications so users work with mainframe information precisely the way you want them to. There's even a special programmer's toolkit that comes with Avatar's API, Hypercard API, and MacWorkstation TLPM module. And naturally, we support all Apple standards and conventions.

Even more importantly, you can expect the responsive service, support and applications expertise that it takes to make a connectivity solution really work.

We have a free brochure on Mac-to-mainframe connectivity that will answer many of your questions. To receive yours, call us at 1-800-289-2526. Or write: Avatar Corporation, 65 South Street, Hopkinton, Massachusetts 01748.

FROM PAGE 47

You have to admit, the come-on is attractive. They're saying you can buy a 386SX for the same price as a 286 system and with it you'll be able to run "all the new 386 software."

What kind of choice is that?

Well, it's a fool and his money that are easily parted. Sure, you can buy a 386SX for the price of a 286, but not from the same source. And running the "386 software" is no easy boast to make because there is precious little of it out there.

Scan the direct mail listings and you'll be able to find a full-function 386-based system, skipping the limited-function SX version, for less than you can buy a 286-based system from Compaq or IBM. So what's new there? If you wait a couple of months, you'll probably be able to buy a 486-based system for similar savings. But if you compare any one vendor's offerings, you'll find a \$500 to \$1,000 premium is the price tag for listening to Gates and Intel.

In point of fact, the older-generation processors, even those souped-up PCs using even earlier-generation chips, may be more than enough to run the

software that is currently available today. Most people will be able to tune older technology devices with the use of faster peripherals and added memory. A select few will indeed need the latest and the greatest.

So, what's behind this big campaign to cut off the 286? In this corner, the explanation is that the two micro stalwarts are quite simply failing back on a trusty business principle: If you can't convince the public

IGNORE the ads. Make your decisions based upon what you determine to be your needs and preferences.

with technology, scare 'em.

There are good business reasons for this. Intel is not the sole-source commercial supplier of 286 chips, but it is for the newer microprocessors. Microsoft hasn't been able to convince the world that OS/2 is for you and, despite some bet-covering in the Windows arena, OS/2 is where the firm's fortunes lie.

But what is good for them is not necessarily good for you.

You may have many people and functions that simply do not require a more powerful PC or have no need for software that is still basically an empty promise. A faster modem, faster disk drive and improved memory can do wonders for older generation systems running the bulk of software available today.

If you have signed on to OS/2, or have people with huge spreadsheets and databases, it may in fact be time to make the switch.

What is so aggravating, however, is that two prominent and heretofore respected computer companies are trying to��daze their customers to make faulty strategies pay off. They are engaged in marketing tactics that are misleading at best and, in the case of the Intel advertisements, about as close to deceptive practices as you can get without attracting the attention of the U.S. Justice Department.

So, ignore the ads. Make your decisions based upon what you determine to be your needs and preferences. And when Microsoft and Intel salesmen come calling, tell them, "Show me. Don't tell me."

Nantucket attempts to reach SQL from Dbase

BY CHARLES VON SIMSON
CW STAFF

LOS ANGELES — Nantucket Corp. will attempt to stretch its investment in Ashton-Tate Corp. Dbase-dependent technologies into the realms of other SQL relational database systems.

It is a stretch that experts say can be kludgy and may offer sub-optimal performance.

Nantucket plans to demonstrate the first of its Database Driver series of products at Comdex/Fall '89 this week. A driver for Borland International's Paradox files will be the first one introduced, followed by SQL drivers for Microsoft Corp.'s SQL Server, Gupta Technologies, Inc.'s SQL Base and Novell, Inc.'s SQL. Nantucket hopes these capabilities will encourage third-party and internal corporate Clipper developers to use the product for developing non-Dbase products, because they will be able to stay within Nantucket's Clipper syntax.

However, many SQL devel-

opers say procedural interfaces to SQL databases are often cumbersome. Procedural interfaces, such as the Clipper drivers, access one record at a time, while standard SQL works at the set level, accessing several records simultaneously.

"The translation between the two defeats the SQL optimiza-

IT IS A stretch that experts say can be kludgy.

tion," said Fabiano Pascoli, an independent SQL specialist from Washington, D.C. "Companies like Nantucket with a Dbase investment are simply trying to kill two birds with one stone, but it is wishful thinking that by doing this they will be in the relational database area."

Borland sources said that while they support Nantucket's efforts to build drivers between the two environments, the Clipper solution is a compromise.

"Our inventory and distribution problems won't go away until we get a system meant to solve them."

Peripheral

FROM PAGE 47

and unable to swallow the extra cost of developing products for both, have been holding off.

"They are waiting to see which side of the fence the buses and the users come down on," said Dan Ness, an analyst at market research firm Computer In-

telligence in La Jolla, Calif.

At the same time, realizing that peripheral availability could help sway users, architecture champions such as Compaq and IBM have been trying to coax third-party developers to their sides. Whether the effort payed off may start to show up in the next month or so, particularly at Comdex/Fall '89.

"We'll see quite a few [pe-

ripheral rollouts] at Comdex; it's going to be a very big show for the bus architectures," Ness said.

A spokeswoman for Hewlett-Packard Co., which unveiled its first EISA PC last month, estimated that 15 different vendors will announce EISA peripherals this month.

At Compaq's EISA rollout, Proteon, Inc. and Codenoll

Technology Corp. unveiled 32-bit EISA fiber-optic Token-Ring boards and an Ethernet interface card, respectively.

Maitland, Fla.-based Distributed Processing Technology unwrapped a small computer systems interface (SCSI) disk array controller for EISA machines at the Compaq briefing. The device reportedly features a direct-memory access transfer rate of

33M byte/sec.

Also among the companies planning to show off peripherals is Myplex Corp. The Fremont, Calif.-based company will show up at Comdex with its new 32-bit graphics board, Ethernet adapter and SCSI caching controller for EISA PCs.

Apple

FROM PAGE 47

that the snappy user-friendly features that once distinguished Apple — windows, icons, pull-down menus — have been liberally borrowed by many firms and could no longer be leveraged as an exclusive selling point.

Recently, powerful tools have been added to the Apple line, including A/UX — Apple's version of the Unix operating system that was developed to better its chances when competing for government contracts.

Additionally, the company recently introduced the Macintosh IIci, a high-powered personal computer that competes squarely against low-end workstations.

Perhaps the most important of these tools was the suite of connectivity products introduced last June.

These tools sweeten the firm's corporate lure by enhancing the Appletalk network system's ability to communicate with Digital Equipment Corp. and IBM shops — the cornerstone environments of most Fortune 1,000 firms.

Analysts see the realignment as important for the company. "Apple will always primarily focus on the individual, but in order to become a \$10 billion company they realize that they cannot shut their eyes on the corporation," said Bessy Lorenza, an analyst with the San Francisco-based Voice, Covington & Welty investment banking firm.

Bank group

FROM PAGE 49

memory and a 120MB/hard drive, which replaced a 40MB/buffer drive. "I ran out of that real fast," she said.

"My biggest complaint about running Excel and anything else in Windows is that it eats up so much memory, particularly if I'm doing a lot of linking," Vincent said. She is hoping Windows 3.0, with its promise of improved memory management, will address this.

Despite Vincent's experiences with Excel, she admits that it has been hard to convince other Citibank employees to use it. "They're all so into Lotus; they're just diehards." Still, she is finding herself giving more walk-throughs of Excel to interested staff members, most recently from the New York office.

NEW PRODUCTS

Systems

Open Systems, Inc. has announced a turnkey, AT&T Unix System V-based workstation that incorporates the recently introduced Motorola, Inc. 88000 25-MHz architecture.

The Personal Mainframe/8000-25 workstation performs at 21 million instructions per second and was designed for computer-aided design and manufacturing, software development and office automation applications, the company said. The system can also function as a file server.

Entry-level pricing for the Personal Mainframe/8000-25 is under \$10,000.

Open Systems
Building 400
20863 Stevens Creek
Cupertino, Calif. 95014
408-446-2110

Epson America, Inc. has introduced a laptop computer with a removable hard disk drive system.

According to the vendor, the Equity LT-286c comes equipped with a Datassafe disk drive that allows end users to easily re-

move the standard 20M- or 40M-byte hard disk drives for added security, upgrade or exchange purposes. The 13-pound computer can be powered by either an AC adapter or a removable nickel cadmium battery and comes standard with a 3½-in., 1.44M-byte floppy disk drive and 8-MHz or 12-MHz switch-selectable clock speeds.

The Equity LT-286c is bundled with Epson MS-DOS Version 4.01, and it is priced at \$4,599 for a 20M-byte hard disk configuration and \$4,999 for a 40M-byte hard disk model.

Epson America
235330 Hawthorne Blvd.
Terrance, Calif. 90505
213-539-9140

Toshiba America Information Systems, Inc. has introduced an 80386SX-based portable computer.

The company reports that the T3200SX is a 17-pound portable unit with six internal expansion slots, 13M bytes of memory capacity and an IBM Video Graphics Array display system with a gas-plasma monitor.

A 3½-in., 1.44M-byte floppy drive and a 40M-byte hard drive are also included, according to

the company.

The system has an announced list price of \$6,299 with MS-DOS 4.01 standard. Version 1.0 is optional and costs \$325.

Toshiba
9740 Irvine Blvd.
Irvine, Calif. 92718

Software utilities

Softshell Systems, Inc. has introduced an updated version of the Softbreze user interface.

Version 3.0 is targeted at intermediate personal computer users who want to bypass DOS commands and organize their hard disks, the company said. The character-based program provides users with menus for task switching and for file, disk and memory-management functions. It requires less than 30K bytes of memory and carries a retail price of \$99.

Softshell Systems

Development tools

Piano Computer Sales has released an enhanced version of the company's Dots + Base database management system.

Version 3.97 has the capacity to accept over a billion records, the vendor said. The software program was designed to provide a menu-driven system for developing applications competitive with Ashton-Tate Corp.'s DBase III and DBase IV packages. Features include the ability to import, export and print memo fields, as well as a built-in application generator. The product is priced at \$39.95.

Your systems just aren't keeping pace. Sometimes the information is late. Sometimes it's wrong. And in your business, having that kind of information is like having none at all.

Hewlett-Packard has a better way.

Transaction-processing systems that update, retrieve, and analyze data. Immediately. And accurately. Systems that are designed to respond easily to changes and growth in your company.

HP 3000 systems already process transactions for thousands of commercial businesses worldwide. And because every one of those businesses is different, the systems accommodate an impressive range of tailored

applications from third party developers.

For one of the world's largest booksellers, an HP 3000 system manages every aspect of the company's phone and mail order business. When customers call regarding the status of an order, the system provides immediate answers 95% of the time.

And for a major athletic shoe company, Hewlett-Packard is providing solutions in the areas of inventory control and distribution. Over the past three years, HP systems have supported sales that have soared from \$80 million to \$700 million.

When you put a computer system in charge of critical data, reli-

ability has to be more than a promise. That's why so many companies are backing every transaction with Hewlett-Packard. Because we've been promising and delivering exceptional reliability for over 50 years.

Timely, accurate information makes all the difference. To make a difference for your company, call 1-800-782-4900, Ext. 2865 for the HP sales office nearest you.

There is a better way.

Whatever the critical transaction, Hewlett-Packard can tailor a solution.

UnshakaBull

Bull® renews its steadfast commitment to midrange customers
with the new ultra-powerful DPS 6000 family.

KNOW BULL

Bull stands behind you by staying ahead.
Case in point: our new DPS 6000 family. It's an evolutionary power surge from our DPS 6 and DPS 6 PLUS families. It's a revolutionary launch pad to UNIX® operating systems.

Where else can you get the compatibility and multiprocessing advantages of our GCOS 6 HVS operating system plus 3 times the power of a DPS 6 PLUS, room for as many as 300 users, the best

transaction processing value in the industry *and* the option of simultaneous peer processing. Which means access to one of the largest collections of commodity business applications available today.

In Alabama, one of the world's leading medical centers is staffed by a bunch of country doctors.

The University of Alabama at Birmingham co-sponsored this ad with the State of Alabama.

They serve the whole country—and the world.

The following comments are by Charles A. McCallum, M.D., President of the University of Alabama at Birmingham.

"A specific goal was set when our medical center was founded. That goal was to be, not just another state institution, but a national resource.

"We've quickly attained a national and international reputation. In every book that judges hospitals, the Univer-

sity of Alabama at Birmingham

has been rated among the best.

"More than a score of highly recognized centers of excellence have been developed at this university, including a Comprehensive Cancer Center, a cardiovascular research training center, and a multipurpose orthopedic center—to name just three.

"We've concerned such foundations as our Medical Information System. Doctors can call here, toll free, to discuss their patients' problems with our doctors. We respond to over 71,000 calls a year.

"And our critical care transport system can bring patients here quickly and safely. We can transport them in our jet while giving them all the care they would get in a surgical intensive care unit.

"By working to be the best anywhere, we're helping to make Alabama the best state to live in."

ALABAMA The Great Surprise.

Software applications packages

Retrieval Technologies, Inc. has announced a full text and image retrieval software program designed for use with magnetic media and compact disc/read-only memory applications.

Called Research, the product reportedly allows users to build personalised libraries from either scanned materials or information downloaded from databases or from data sets or word processing programs. The software requires an IBM Personal Computer AT or compatible with a minimum of 640K bytes of random-access memory and MSDOS 3.0 or higher.

Research is priced at \$695. Network licenses are available. Retrieval Technologies Building 100 1 Kendall Square Cambridge, Mass. 02139 617-577-1574

Armor Systems, Inc. has released version 2.0 of its accounting software for Sun Microsystems, Inc. 3966 Richardson.

Excaliber + Premier is said to have networking capabilities and is available for both the Sun 3/60/150 and 3/60/250 workstations running under SunOS version 4.0 and higher. Thirteen applications are offered, including general ledger, accounts payable, accounts receivable and inventory control, and a separate application, Report Generator, creates customized reports.

Most modules retail for \$995; Bank Reconciliation and Customer Information each sell for \$595. Report Generator is priced at \$1,095. Armor Systems 324 N. Orlando Ave. Maitland, Fla. 32751 407-629-0753

Chronologic Corp. has announced a memory-resident personal information manager for the IBM Personal Computer and compatibles.

Instant Recall reportedly runs in 32K bytes of random-access memory, accessible at a key stroke without having to exit other applications. According to Chronologic, information can be stored in four formats: free-form notes; task delegation and tracking; scheduling; and information about people and organizations. An information item is said to incorporate up to 65,000 characters, and any one of the possible multiple databases can hold up to 10 million characters.

Requiring DOS 3.0 for the memory-resident operation and a 720K disk capacity, the price is \$99.

letting go of the past.

OS/2 can do!

Making the move to OS/2® isn't all or nothing. In fact, OS/2 and DOS can work together—in the same office, on the same network and even on the same workstation. So it's easy to protect your current hardware and software investment.

The key is compatibility. You can take advantage of powerful new OS/2 software, run most of the top DOS applications or toggle back and forth as the tasks demand it. A dual-boot feature also allows you to choose a pure DOS or OS/2 environment at any time.

And don't be surprised that most of your favorite DOS applications are now available for OS/2. They've been redesigned and go beyond DOS memory limits to provide additional functions that help you be more productive—with the benefits of multitasking and OS/2's graphical interface, Presentation Manager.™

Want to keep what you have and still move into the future? With OS/2, the solution is IBM.

To find out more about OS/2, contact your IBM Authorized Dealer or marketing representative. For a dealer near you, call 1 800 IBM-2468, ext. 205.

Choose OS/2 now and get rebates on memory and software. Also get an upgrade to Version 1.2 free until December 31, 1989.

IBM

PCs & WORKSTATIONS

Sapana Micro Software has upgraded its mailing list management packages for IBM's Personal Computer, AT, PC Convertible, Personal System/2 and compatibles.

Features of Mail-Track II and Mail-Track III reportedly include a utility that creates mail application templates and report-generation formats, 10 levels of duplicate detection operation and a faster sorting method.

Not copy-protected, Model II sells for \$95, and Model III is priced at \$195. Owners of older versions can upgrade by sending \$19 and their original diskettes to the company.

1305 S. Rousse
Pittsburgh, Kan. 66762
316-231-5023

Panaceas, Inc. has announced a software product designed to support the IBM 8514/A graphics adapter at the register level.

The Display List Driver 8514/A for Autocad replaces the driver that comes with Autodesk, Inc.'s Autocad Release 10, increasing redrawing, zooming and panning performance. It also supports Autodesk's AutoCAD and AutoSketch.

Available in September, the introductory price is set at \$149.

Panaceas
Leadenham Square
Suite 305
56 Nussbaum Road
Leadenham, K.N. 03053
603-437-5622

Autodesk, Inc. has released a desktop video application for IBM Personal Computers, Personal System/2 and compatibles. Autodesk Animator is an animation and paint program that can be used for developing

sophisticated animated presentations for video applications. The program offers five types of animation techniques, frame processing, 572 color print effects, a menu editor and video connection capabilities.

The price is listed at \$299. **Autodesk**
2320 Marinaside Way
Sausalito, Calif. 94965
415-332-2344

Compass Systems Corp. has announced a multimedia software package developed for the investment advisor. It is designed specifically for National Datacomputer, Inc.'s MS-DOS handheld device.

Called Intakes, the software reportedly includes financial and audit verification functions and provides for location, department and item category segre-

gation, the library functions are pre-defined for nearly 100 instruments from more than 20 manufacturers. The package sells for \$349.

Voyetra Technologies
333 Fifth Ave.
Pelham, N.Y. 10803

Computer Support Corp. has added support for color tagged image file format (TIFF) 5.0 to its Arts and Letters Graphics Editor Version 2.0.

Version 2.0 of the Bezier curve illustration program reportedly lets users import and export content in TIFF 5 standard used in various software and paint programs. According to the vendor, the user can merge the scanned photographs and bitmapped artwork with Bezier curve-based illustrations, clip art and outline typefaces that are already available with the editor and can print them on devices supported by Microsoft Corp.'s Windows Version 2.0 for \$695.

Software Business Technology Corp. (SBT) has upgraded its series of accounting software to provide more flexibility and ease for the user.

Version 6.3 of the Series Six

Plus Database Accounting Library reportedly features changes in the user interface, redesigned user menus, automatic installation, light bar menus and flexible data file directories. Programs are available for the general ledger, accounts receivable, accounts payable, purchase orders and sales orders at \$95 each. The packages run under MS-DOS, Xenix and Unix, support both single and multiuser or local-area network systems and include source code. Compiled single-user programs that do not include source code retail for \$295 each.

i-Batch2
One Harbor Drive
Sausalito, Calif. 94965
415-331-9900

Levenbach Associates, Inc. has released an updated version of its forecasting software product for users of Lotus Development Corp.'s 1-2-3 and Symphony spreadsheets.

i-Batch2 was designed to access spreadsheets directly on the personal computer's hard disk, the vendor said. The package reportedly allows users to forecast thousands of stock-taking units, budgetary items or product sales in a single run. It is priced from \$2,900, and customization support and training are available.

Levenbach Associates
Suite 248
103 Washington St.
Morristown, N.J. 07960

MAKE YOUR SOFTWARE LOOK AS GOOD AS IT PERFORMS

Pinel Group

Pinel Group is a leading provider of high-quality electronic components and solutions. Our products are designed to meet the highest standards of performance and reliability, making them ideal for a wide range of applications. From logic and memory chips to power management and connectivity components, we offer a comprehensive portfolio of products that can help you take your software to the next level. Contact us today to learn more about how we can support your development needs.

PostScript® laser printers
used to be expensive, large and
shared by an entire office.

Until now.

microLaser from Texas Instruments: the affordable PostScript printer users can call their own.

Finally, for less than \$3,000* users can have a PostScript laser printer right at their desks. TI introduces its new microLaser, with the features users want — now and in the future.

Small size. Lots of value.

At only 13.4 inches wide and 14.2 inches deep, microLaser may be the small kid on the block, but it packs plenty of punch. This printer takes full advantage of powerful PC software. That's because it uses the Adobe® PostScript printer language and is compatible with the HP LaserJet® Series II — allowing the user to switch between them easily. With that kind

of flexibility, the six-page-per-minute microLaser is ideal for word processing, spreadsheet and desktop publishing applications.

Because microLaser features the PostScript language, it prints fonts in a variety of type styles and sizes. Plus, it can print them tall-ways, long-ways, all kinds of ways. It even prints complex pages of integrated text and graphics.

Capabilities that grow as their needs grow.

One of the best things about microLaser is that users only buy what they need. So if they're not ready for PostScript language, they can buy the standard microLaser for less than \$2,000** and add PostScript software and other powerful features later.

Users can upgrade microLaser without tools or technicians by simply adding upgrade boards. These boards include up to four 1 Mb increments of memory, serial and AppleTalk® interfaces and a PostScript interpreter. All they have to do is get additional fonts or emulations is plug optional microCartridges into two credit card-size slots.

Superior paper handling.

Part of what makes microLaser a truly personal, desktop laser printer that takes up so little room is its paper drawer, which slides inside. Because microLaser holds 250 sheets standard (it holds 500 with an optional paper drawer), users spend less time refilling paper and more time creating superb-looking documents.

The printer also handles a variety of

FREE! Adobe typefaces from TI.

What could be more affordable than that? When users purchase a TI microLaser with PostScript, they get their choice of an Adobe Publishing Pack for their PC or Macintosh® (up to a \$475 retail value). Selected by publishing experts, each Pack features three high-quality Adobe typefaces proven to work well together in a specific application, such as newsletters, forms and schedules or presentations.

Not only that, they get an expert-written "How To" booklet so they can get started quickly and easily.

Call TI at 1-800-527-3500 for details! This offer ends March 31, 1990.

paper sizes and types — from letter, legal and executive to transparencies, labels and envelopes. For those times when users face a large mail merge task, they can just plug in an optional envelope feeder to easily alternate between letters and envelopes.

The affordable PostScript printer is a call away.

To find out more about how your users can have affordable PostScript printing right at their desks, call TI today: 1-800-527-3500.

*TI suggested list price is \$2,999.

**TI suggested list price is \$1,999.

TEXAS
INSTRUMENTS

Now there are two ways to drive your network on a 386.

Manual.

Novell went to a lot of effort to get NetWare™ to perform on a 386™ Microprocessor. But you'd have to go to considerably more effort to get it to perform like VINES™.

Unlike its competitors VINES is based on an international standard, UNIX® So applications and communications programs are easy to integrate. That's why capabilities for E-mail, X.25, SNA and async are already included. And since VINES was built from the start to integrate anything from a PC cluster to an enterprise-wide network, it has one big advantage. A global naming system called StreetTalk™.

Which is nothing new to the VINES users who've been enjoying proven 386 performance for over a year. But to those who are still waiting for NetWare to catch up, remember, it's never too late to shift gears.

BANDAI Networks for those who think big.

Elizabeth Horwitt

In search of CIM reality

For the past few years, I have gone to the Autodesk conference for an update on whether computer-integrated manufacturing (CIM) is finally becoming a technically viable, business-justifiable discipline instead of an amorphous mass of conflicting aims and half-baked products.

Walking the floors of this year's show, I reluctantly concluded that manufacturing and engineering managers are still struggling to define their CIM dreams and goals. The evidence is that they finally seem to be admitting they need help—from outside consultants and—even from their own internal IS departments. This seems like very good news.

Most existing CIM projects arose from the shop floor and are.

Users hail Tariff 12 decision

ANALYSIS

BY MITCH BETTS
CW STAFF

WASHINGTON, D.C. — Sure, it was a victory for AT&T when the Federal Communications Commission (FCC) upheld the legality of Tariff 12 last month. Tariff 12 is AT&T's weapon in the highly competitive battle for custom business networks.

But more importantly, it was a victory for users, according to Henry D. Levine, an attorney at

Washington-based Morrison & Foerster who represents a slew of major user companies.

The user victory came on several different levels. Obviously, the fact that Tariff 12 remains in effect means that 19 companies with Tariff 12 contracts from DuPont Co. (Option 11) to National Semiconductor Corp. (Option 19)—are relieved to know that they do not have to rip out their networks.

Second, the FCC action means that Tariff 12 is open to more users, unless it is over-

turned in court. AT&T predicted at least 50 more Tariff 12 customers by the end of 1990.

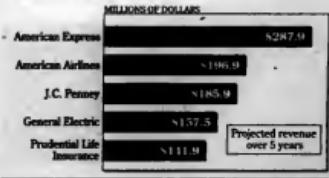

Third, it was a victory for the user community's vision of competition in the high end of the market, Levine said. In other words, users have enjoyed watching AT&T, MCI Communications Corp. and U.S. Sprint

struggles on Tariff 12 contracts, the users sprang into action. Seventeen large users, rounded up by Levine, sent a letter urging the commission "not to fix something that is not broken."

Some of the letter signers were AT&T customers, such as Tariff 12 user Prudential Life Insurance Company of America. But other signers included Merrill Lynch & Co., Chrysler Corp. and Chase Manhattan Bank NA—three major customers of

Major commitments

The top five Tariff 12 customers each have contracts with AT&T worth more than \$160 million

Mac network developers expand TCP/IP horizon

BY JAMES DALY
CW STAFF

SAN JOSE, Calif. — Novell, Inc. announced recently that it will add Apple Computer, Inc.'s MacTCP driver to its TCP/Port Developer's Toolkit, thus allowing Macintosh networking developers to write to their choice of either company's Transmission Control Protocol/internet Protocol (TCP/IP) drivers.

Prior to the pact, developers writing to the TCP/IP/Macintosh environment needed to write separate applications to each noncompatible driver, significantly lengthening both the development process and the time to market.

The driver is a piece of system software that takes re-

quests from an application, provides a protocol and puts it out over a network.

The full product will be released in January by Novell subsidiary Exceis, Inc.; with site license and commercial development fees beginning at a price of \$2,500.

The pact continues Apple's move to broaden its range of connectivity products. Novell's Netware operating system has become a standard for many personal computer local-area networks.

Last June, Apple revealed a wide-ranging suite of networking tools specifically designed to speed the Macintosh's entry into both IBM Personal Computer and Digital Equipment Corp. environments.

Communications Co. scramble to offer more sophisticated and cheaper services to the Fortune 500.

"Users have always tended to let this be a fight between AT&T and its competitors and to stand on the sidelines. But over the last six months, users have begun to see very substantial benefits from the competitive marketplace [for custom network contracts], and they wanted very much to preserve that competition," he said.

In mid-October, when there were rumors that the newly appointed FCC might place new re-

MCI—and Bankers Trust Co., which is one of U.S. Sprint's biggest customers.

In other words, MCI and U.S. Sprint customers supported Tariff 12 even though their carriers strongly opposed it and are fighting it in court. The letter said that users are united in their opposition to all efforts to interfere with the current trend toward competition, whether directed at AT&T or its competitors. For example, they also opposed AT&T's pending complaint against MCI's off-tariff deals [CW, Sept. 25].

Commtex unwraps PRI desktop link

BY JOANIE M. WEKLER
CW STAFF

In a move that brings 1.5M bit/sec. Integrated Services Digital Network (ISDN) connections to the desktop, Centrex, Inc. last month enhanced its CX-80 3174 cluster controller/switch to allow IBM Personal Computer XT and PC AT users to send and receive voice, data and full-motion video over an ISDN Primary Rate Interface (PRI).

The interface supports 23 B channels running at 64K bit/sec., plus a D channel for signaling and packet-switched transmission.

The vendor demonstrated an IBM PC running a Lexmark Development Corp. 1-2-3 spreadsheet, while a window on the computer identified the source of an incoming telephone call and a PC user performed keyboard tasks.

A number of existing offerings provide the desktop with the narrower bandwidth of an ISDN Basic Rate Interface. However, PRI connections have been limited to linking private branch exchanges to one another, to hosts or to the public network. To make the PRI connection, users must purchase a \$4,995 line interface module, which resides in the CX-80 and supports five PCs and one server, as well

as a \$1,995 CX-Card. To add voice and video functions, they must also buy a \$695 Voice Subsystem and \$2,500 telephony software for each PC.

Regarding the pricing, Chief Executive Officer Don Parker noted that the company's strategy is to offer customized turnkey packages at discount prices that total less than the sum of all the components.

The revised CX-80 uses time-division multiplexing to allocate PRI bandwidth to the voice, data and video functions. PRI links can also run from each networked PC to a file server and from the file server to the CX-80 so that resources can be shared among PCs. A PRI link can simultaneously connect users to Centrex, a corporate backbone and other CX-80s, with each PC able to use the full PRI link.

FDDI still in holding pattern

BY JOANIE M. WEKLER
CW STAFF

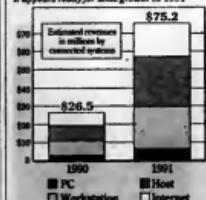

FRAMINGHAM, Mass. — Despite the recent wave of FDDI product introductions and demonstrations, widespread deployment of 100M bit/sec. fiber networks is likely to remain on the horizon for another two years, according to a recent report by market research firm International Data Corp. (IDC).

IDC said that large-volume end-user Fiber Distributed Data Interface (FDDI) sales will not take off until at least 1991 because of high prices, limited availability of concentrator products and a shortage of commercial applications.

The dual attachment to an FDDI network accounts for much of the current prohibitive \$6,000 to \$12,000 cost per connection, according to IDC analyst Richard Villars.

Almost ready

The market for the Fiber Distributed Data Interface has not taken off as expected, however, it appears ready for solid growth in 1991.

Source: International Data Corp. 1991 FDDI MARKET FORECAST

GOD DIDN'T MAKE LITTLE BLUE APPLES. KMW DID.

KMW brings Apple and Big Blue together. KMW makes your Macintosh more versatile - more productive - by linking it to your IBM midrange. Our line of TwinAccessTM protocol converters connect any Macintosh to your System/3X or AS/400.

New board connection for the Mac II. For a simple, cost-effective board solution, choose our TwinAccess for the Mac II. This easy-to-install card plugs into any member of the Mac II family, with connection to your host through twisted cable.

Field-proven multiport products. Our TwinAccess protocol converters benefit your Macs, your

converters are ideal when you need remote attachment capabilities, or when you need support for up to seven devices. TwinAccess system-level protocol converters provide midrange connections for any Macintosh, as well as IBM PCs and compatibles, laptops, ASCII terminals, and most popular printers. We can also help you connect to a menu, a data PBX, AppleTalk, or DECnet.

Powerful features on every level. TwinAccess protocol converters benefit your Macs, your

other peripherals, and your host, with these features:

- file transfer to and from your host
- terminal emulation
- manipulation of IBM midrange data within software programs such as Excel, Lotus 1-2-3, and MacWrite
- access to your host's mass storage capabilities
- printer pass-through to ImageWriter and LaserWriter

Tariff 12

FROM PAGE 71

In the end, the FCC decided to leave Tariff 12 alone despite the petitions for reconsideration [CW, Oct. 30]. The commission added language re-emphasizing that Tariff 12 is not a "blank check," and its options must be generally available to other customers. However, observers said that may have been window dressing to strengthen the FCC's case in court.

The victory also demonstrated the user community's lobbying clout. The letter from 17 users "may have been a factor that bolstered the commission's resolve," Levine said. "I believe the FCC was impressed that this was no longer just a fight between big carriers, but that, in fact, the user community was saying: 'Don't mess with this marketplace.'"

Over the years, the FCC has "always been a little frustrated that it always hears from the industry, as opposed to users. So when users come in with a loud voice . . . that has gotten a good hearing," Levine added.

Now, the battle over Tariff 12 shifts to the U.S. Court of Ap-

peals for the District of Columbia, where MCI, U.S. Sprint and the Independent Data Communications Manufacturers Association (IDCMA) have filed appeals seeking to overturn the FCC's decision.

The critics have argued that Tariff 12 is illegal on a variety of grounds. MCI, for example, said it is "ridiculous" to believe that the Tariff 12 options (designed

with specific customers in mind) are generally available, as required by law.

MCI further objected to Tariff 12 as a "façade which simply allows AT&T to target specific discounts to specific subscribers and to tie or bundle unregulated services [such as free or discounted equipment] with regulated services to sweeten the deal," the company said in a prepared statement.

Critics also want AT&T to disclose more details about Tariff 12 contracts. The IDCMA complained that systems integrators have different treatment of the government portion of user networks when AT&T is allowed to have "secret prices" for its equipment hidden in Tariff 12 contracts. "AT&T must not be allowed to use its market position in the telecommunications equipment business to advance its transmission service rates," MCI added.

—With the appeal court, "will have to decide whether — as the IDCMA put it — the FCC has taken a radical departure from its rules that require complete disclosure of carriers' rates and that prohibit unreasonable discrimination among users."

NCR Tower to serve PC nets

NEW YORK — NCR Corp. recently became the first hardware vendor to team with Novell, Inc. and deliver a product based on the local-area network leader's network software for Unix-based systems.

NCR has licensed Portable Netware to provide what it is calling Tower Netware. The software will allow Unix-based Tower systems to act as servers to networked personal computers, including DOS, OS/2 and Apple Computer, Inc. Macintosh systems. Alternatively, the Tower systems could be used as Unix processors running Unix applications.

NCR is the first to reach market with a Portable Netware implementation. Several hardware vendors, including Data General Corp., Prime Computer, Inc., Hewlett-Packard Co. and Unisys Corp. expressed support for the product when it was announced last March.

There were concerns whether Portable Netware would be compatible with its PC predecessor, the Netware 386 operating system. Although there are differences, an NCR official said, "You would have to be a microscopic expert to see them."

Several software vendors hailed the announcement as a step forward in bridging the Unix and PC-DOS worlds.

Epson EPL-6000, HP emulation, 300 x 300 DPI, 6 PPM, 512KB RAM, expandable to 4.5MB, 6 resident fonts, Two option font slots, Enhanced SelectType control panel, One year limited warranty.

UNTIL NOW,
LASER PRINTING HAS BEEN OUT OF REACH FOR
MANY PEOPLE IN BUSINESS.

HP LaserJet II is a registered trademark of Hewlett-Packard. Epson is a registered trademark of Seiko Epson Corporation. Epson America, Inc., 2780 Lamis Blvd., Torrance, CA 90505. (800) 922-8911.

*With the new, affordable EPL-6000
from Epson, more businesses will be
looking better on paper.*

As for value, this new Epson combines solid, businesslike performance with a price that is as attractive as the printing. In fact, for quality, reliability and value in a laser printer, you could say Epson has the solution well in hand.

Opting for the quality of a laser printer has just become decidedly easier. Introducing the EPL-6000 laser printer from Epson.[®]

Coming from the company with the longest running success in the printer business, reliability is a given. What's more, the new EPL-6000 is compatible with application software written for the HP LaserJet II[®].

YOU'VE GOT A LOT OF COMPANY.™**

Intensive care for fragile LANs

Local-area network diagnostic tools are growing both in number and level of sophistication, offering users a possible solution to increasingly serious LAN maintenance problems, according to a white paper issued by the consulting firm Arthur D. Little, Inc.

"Corporations have found personal computer LANs to be both hostile and fragile," wrote ADL senior partner Harold Cypress in a white paper he co-authored with ADL senior consultant Gilbert Hirsch.

Rapidly evolving LAN technology has left many users behind and made them cautious about changing a configuration once it is up and running, according to the authors, who said

they interviewed over 100 users.

Users and vendors are in dire need of better LAN support tools, the authors said. "The average PC user is on or off [the] LAN already has to spend something upwards of 25% to 30% of his time in nonproductive activities associated with acquiring technology, reorienting to applications, dealing with files, backup, diagnostics and troubleshooting," Cypress said.

An emerging generation of LAN-oriented diagnostic tools, of which Network General Corp.'s Sniffer was an early example, could help ease the load, Cypress said. However, such products should not simply add to users' nonproductive activities, he added.

ELISABETH HORWITT

Cures offered for LAN woes

BY ELISABETH HORWITT
CW STAFF

The local-area network diagnostic industry, which has long lagged behind other management areas, has gained momentum in recent months with a spate of products designed to provide the reliability users need to safely tie LANs into the corporate network. Among the recent announcements are the following:

Network General Corp. in Mountain View, Calif., has announced Sniffer Express, a rental program designed to provide users with overnight access to a Sniffer network diagnostic device when trouble develops on their LANs. The high-end Series 500 Sniffer can be rented for \$1,000 per week, the company said.

A software program that allows Network System administrators to access the screen and keyboard of any personal computer on a network from the administrator's workstation was announced by Lan Systems, Inc. in New York. Dubbed LanWatch, the program reportedly permits administrators to assess the config. of a remote PC by running network analysis and other diagnostic programs directly from the workstation. The product costs \$395 per server. Deliveries are scheduled to begin this month.

Vance LAN enhancer

Vance Systems, Inc. in Chantilly, Va., announced enhancements to its ATS 1000 Token-Ring LAN Analysis System that are said to allow the product to capture and analyze data for both 16M bit/sec. LANs and IBM's Systems Network Architecture (SNA).

Priced at \$17,995 and scheduled to ship in the first quarter of next year, the baseline 16M bit/sec. ATS 1000 includes an IEEE 802.5 network interface, MSDOS-based software, a 40M-byte hard disk and software for collecting and analyzing the lower-layer LAN protocols, Vance said. An upgrade from a 4M bit/sec. ATS 1000 costs \$4,000.

The SNA diagnostic feature is said to decode SNA protocols that correspond to Layer 3 or 7 of the International Standards Organization's Open Systems Interconnect model, including IBM LU2.0 and LU6.2 commands.

Hewlett-Packard Co. introduced software packages that are said to allow its HP 4972A LAN protocol analyzer to handle Digital Equipment Corp. Decnet, Transmission Control Protocol/Internet Protocol (TCP/IP) and Sun Microsystems, Inc.'s Network File System.

The HP 18223A Decnet performance analyzer is said to track individual code performance and track interface characteristics, as well as to isolate problems by spotting erroneous packets, on a Decnet network. The HP 18224A Decnet protocol interpreter is also said to provide full-text descriptions of protocols on that network.

HP also introduced the HP 18222A TCP/IP network performance analysis package and the HP 4972A LAN protocol analyzer, which costs \$17,350.

Each of the above products is priced at \$950 and runs on the HP 4972A LAN protocol analyzer, which costs \$17,350.

OPENCONNECT SYSTEMS

Slices of CIM shown at Autofact conference

BY ELLIS BOOKER
OF STAFF

DETROIT — A comprehensive demonstration of computer-integrated manufacturing (CIM) at the recent Autofact '89 conference was no such an exercise in cheerleading as in technology.

Arranged by Autofact's sponsor, the Society of Manufacturing Engineers (SME), the Partnership for exhibition seemed to respond indirectly to the impression held by some that CIM is a better idea in theory than in practice. Users who have tried to put CIM in place have complained about its high up-front costs, notably the need to customize interfaces in multivendor environments.

The Partnership demonstration simulated interconnections among a lawn tractor company's retail outlet, a corporate office and a manufacturing shop floor. Visitors saw a request for a single part assembly move electronically among the multiple hardware and software platforms, networks and operating systems. In all, 21 vendors participated in the exhibit.

However, the 8,000-square-foot demonstration had to be complex, noted

working standards, including the X12 format for electronic data interchange and X.400 for messaging services, a great deal of customization went into linking the networks and software systems. Gengler said the demonstration had taken the assembled vendors and systems integrators a full year to produce.

Worning expectations

The pared-down definition of CIM is new and may reflect the diminishing level of expectations for CIM. Traditionally, CIM has been understood as an enterprise-wide, not departmental-level, architecture.

On the other hand, CIM by the slice is more in line with European methods, according to Lars F. Rojel, a systems engineer at air compressor maker Sabroe Manufacturing Division in Aarhus, Denmark.

"At a certain level, it is true Europe is not quite as technically fancy," he said.

At Sabroe, for example, the Unisys Corp. 2000/600 mainframe, which contains the materials requirements planning systems for scheduling work inside the factory, is not linked to the Apollo computer-aided design and manufacturing workstations.

"We have ideas [on how to link the two

systems], but I'm always warning people that if you can't manage your factory today manually, you can't do it on computer," Rojel said.

Indeed, Americans impressed with Japanese technical sophistication would do well to remember that Japanese manufacturers first developed flawless paper-based systems, such as the index card-based "Kanban" used for tracking components around a factory floor, before converting them to computer code.

Ironically, the more limited notion of CIM was being talked about in the halls of the 11th-annual Autofact just as leading hardware and software vendors began to parade the technical tools to ease the integration of multivendor, multiapplication manufacturing environments.

WE HAVE IDEAS [on how to link the two systems], but I'm always warning people that if you can't manage your factory today manually, you can't do it on computer."

LARS F. ROJEL
SABROE MANUFACTURING

Bruce Gengler, technical manager of computer-aided manufacturing services at Deere Tech Services, which acted as the systems integrator for the project:

Gengler said the demonstration was deliberately designed to be complex and all-encompassing to demonstrate the possibilities of CIM. "Users should see that they can implement CIM by the slice," he said.

The systems were connected over a mixture of Transmission Control Protocol/Internet Protocol (TCP/IP) and Decnet communications software running on top of Ethernet, X.25, IBM Token-Ring and broadband facilities.

However, the Manufacturing Automation Protocol (MAP), an evolving Open Systems Interconnect-based communications protocol, was not anywhere to be found.

While the latest implementation of the standard — MAP 3.0 — could have simplified connections between hardware systems, according to Gengler, SME rules forbid the use of unannounced products in technical demonstrations. Gengler said that when the exhibit was being planned, neither Ford nor Digital Equipment Corp., two of the largest participants in the Partnership exhibit, had announced support for MAP 3.0. Both vendors announced support for MAP 3.0 last month.

While the demonstration incorporated a number of widely implemented net-

How Telebit modems made some fast friends in the LAN industry.

Thanks to Telebit dial-up modems, out-of-building LAN communications have really picked up speed.

And Telebit has picked up a lot of new friends. Friends like the nation's largest general contractor. Using Telebit modems and Banyan's VINES, it transmits payroll information from 35 remote offices to corporate headquarters. In half the time. And has eliminated the cost of leased lines.

Then, there's a national developer of communications software that uses Telebit modems and Novell's NetWare AnyWhere. Throughput between its New York headquarters and remote offices for accounting, E-mail and order entry data has increased fourfold.

Plus a LAN VAR that uses Telebit modems and

3Com's 3+Mail. Its E-mail connections are 5 times faster than before. And its phone and special delivery bills are lower.

Imagine what Telebit modems will do for you.

If you have high-speed, dial-up WAN needs, we should get acquainted. So call today for your FREE application brochure: 1-800-TELEBIT or (415) 969-3800. Or write 1345 Shorebird Way, Mountain View, CA 94043.

Because no one gets the message through like Telebit.

still the property of manufacturing and engineering executives, who tend to view IS with condescension at best; and often with antagonism. But keeping IS away from CIM projects tends to limit the concept to factory automation. Replacing people with computers and robots in effect automates existing processes without making them more effective.

I've noticed that, more recently, the networking side of CIM has been getting a lot of play, primarily from vendors who are trying to gain points from a new willingness to tie into other vendors' systems, in the interests of CIM/harmony.

Look at all the alliances that IBM, DEC and HP have made linking their hosts and CIM platforms with cell controller manufacturers and engineering workstation vendors. Look at IBM's recently announced CIM Architecture, which includes links to a variety of vendors' applications as well as support of MAP 3.0 across most major IBM systems. Look at DEC giving users the option of using either MAP 3.0 and token bus or Decnet and Ethernet, even while Decnet dominates the factory floor.

All of these comparatively recent developments in the networking side of CIM look less horrendous. But networking is just the foundation for CIM. The challenge involves coordination of data flow across various manufacturing areas,

opening the way to benefits like inventory and quality control, faster implementation of change orders, elimination of the costs and inaccuracies of rekeying, and more efficient use of machine, human and materials resources.

Here is where IS should be brought into the CIM process. What's needed is a fruitful partnership that melds very different types of expertise.

A typically illuminating exchange between the two sides might go like this:

IS manager: "If you need real-time data collection, you'll have to buy a broadband T1 multiplexer for a quarter of a million."

Manufacturing manager: "Are you kidding? We don't need real-time data collection. The forklift only stops here four

times a day."

Fruitful dialogue between IS and manufacturing is unlikely to happen without outside help. The ideal third party would bring to the table experience in both the technical and business sides of CIM. It would either provide or recommend software tools that minimize the amount of code needed to implement a CIM system for a client's specific needs. And it would have consultants with background in your particular business, who could help set up a CIM business plan that focuses on practical business needs.

Manufacturing managers' realization that they need help on the business side of CIM has generated a growing market in plantwide systems integration. According to a recent study by Automation Research Corp., in Medfield, Mass., plantwide systems integration services for discrete industries will grow 24% from \$1.7 billion in 1988 to \$2.1 billion this year; and average 20% growth annually through 1993.

Some \$306 million of the integration services purchased last year were from consulting firms, particularly the Big Six accounting firms. The big growth area in this industry is the computer companies like DEC, IBM, Prime and HP, whose market share will grow more than 32% annually, from \$60 million in 1988 to \$227 million in 1993, Automation Research said.

If you have already decided to have your CIM installation on a computer vendor's architecture, it may make sense to turn to that vendor for help when you integrate. But if you prefer a third party whose origins lie in the business consulting sector, with less built-in bias toward a particular hardware platform, you might consider one of the Big Six.

Whomever you choose, the idea is to anchor the CIM vision to the hard technical and business realities, rather than throwing money and automation at problems, hoping some of it will stick.

Horwitt is a Computerworld senior editor, networking.

BIT BLAST

X.400 on move for several firms

AT&T and Western Union Corp. announced last week that they have interconnected their respective electronic mail services via the International Standards Organization's X.400 protocols, giving their users the ability to exchange mail.

Both Tandem Computers, Inc. and Apple Computer, Inc. have licensed GSI-Danet, Inc.'s software package for testing of each of their future X.400 products' compliance with the CCITT standard.

Action Technologies, Inc. has hired Touch Communications, Inc. to provide X.400 support for Action's Message Handling System software.

The enhancement, scheduled for mid-1990 availability, will reportedly provide X.400 connections for a wide range of popular BBS Personal Computer applications that already support Action's software product.

Data Systems

NEW PRODUCTS

Local-area networking hardware

David Systems, Inc. has announced several twisted-pair Ethernet local-area network products.

The Expressnet product line has a modular design for integration and configuration flexibility, the vendor said, and the revised 12-port Expressnet Unshielded Twisted-Pair Ethernet Hub now includes full IEEE 802.3 10base-T and improved board-level diagnostics. It lists at \$2,495.

Two Expressnet concentrators were also announced in five- or 12-slot configurations. They house up to four or 11 Expressnet twisted-pair hub modules, respectively, and one Expressnet Supervisor module. Each concentrator can support up to 48 or 132 users, respectively, and pricing is less than \$200 per port for a 500-node network. The Expressnet Supervisor module integrates physical-layer network management of all hubs contained in the concentrator. Delivery is scheduled for the first quarter of 1990.

Equion Systems, Inc. has unveiled a 12-port multilayer board for connecting high-speed terminals to AT&T Unix System V/Xenix-based multipersonal computer systems.

According to the vendor, the Megaport-12 requires a slot in an IBM Personal Computer AT-compatible chassis and provides 12 asynchronous RS-232 ports. As many as eight boards may be installed into a PC, and customers can choose either DB-25, RJ-11 modular jacks or telephone-type punch block terminations. The board is priced at \$1,295 and scheduled for availability this month.

Local-area networking software

A network management software package for users of Autodesk's AutoCAD is now available from Nth Generation.

Christened CAD Manager, the documentation management system is said to be especially tailored for use with AutoCAD running on Novell, Inc. networks.

The software automatically spoofs AutoCAD drawing output to each user's default printer or plotter, and users may queue plots for off-line processing. A site license costs \$1,195.

Nth Generation
124 Venise Ave.
Cincinnati, Ohio 45140
513-677-0642

CBIS, Inc. has announced a network operating system designed to support up to 255 users.

Network-OS version 6.3 utilizes a point-and-shoot installation program and is reported to be compatible with all IBM Personal Computer-compatible network software, as well as most Novell Netware-specific applications.

The cost of Network-OS ranges from

\$320 for two nodes to \$2,550 for an 81-255 user license.

Allay Computer Products, Inc. has introduced the latest version of its Microsoft Corp. DOS-based multilayer, multibitmask system.

The 386/Multiware Version 1.1 reportedly permits users to connect as many as 20 personal computers or terminals to an 80386-based host PC. According to the company, each user can perform up to eight tasks simultaneously and share an assortment of peripherals.

A three-user system, which includes all the necessary components except CPU, terminal and cables, lists for \$1,690.

TO MOST PROGRAMMERS, TEST IS A FOUR-LETTER WORD.

Everyone knows that software testing isn't a job that inspires kind words. In fact, even the most patient programmers and users have been known to spout strings of expletives when facing endless testing tedium.

But now you can clean up your act (and your testing) with TRAPS™. The revolutionary PC-based Testing/Recording And Playback System that increases testing productivity by up to 800%.

TRAPS automatically detects and captures mismatches in data, cursor positioning and attribute bytes - without the need for coding test scripts. With TRAPS, even the smallest discrepancies are identified and isolated - before they cause problems in production systems.

TRAPS is a registered trademark of TRAVTECH, Inc.

TRAPS breaks through the acceptance and regression testing barrier. As a development and maintenance tool TRAPS offers you a host of benefits in terms of time savings, quality assurance and productivity.

TRAPS. The Testing/Recording And Playback System you swear by. Not at.

Just a few of Dual

THE BEST MODEM FOR NETVIEW ISN'T FROM IBM.

When we announced the new DualView Management Option for 2600 Series modems, it made big news.

And the biggest news is, for the first time you can choose a modem for NetView based on capability instead of compatibility.

So if you need a leased-line modem for NetView at speeds up to 19.2 kbps, now you can get it with DualView.

Along with an integral time division multiplexer, fully automatic dial back-up, and other exclusive features.

DUALVIEW MAKES NETVIEW WORK BETTER.

DualView expands NetView's modem management capabilities with 10 unique built-in features unavailable on IBM modems.

Plus DualView totally bypasses NetView/PC, so you can monitor your modem network directly from NetView.

Digital Comm.

Codex Modem Management System Gives NetView Users More Control

white for U.S.-based vendors, according to I.D.C. figures.

"Codex customers can upgrade their existing modems with our software," said Ries.

"I don't know why nobody thought of this before," said Ries, an analyst with The Yankee Group.

IBM's modems are standard, and therefore work with PDA computers. NetView only routes to communications links while the Codex system links network routers before a problem begins to degrade.

Codex customizes Netview link

BY ELIZABETH BROWNSTEIN
OF THE STAR

CANTON, Mass. — Codex Corp. introduced last week what may be the first direct link between a non-IBM board-line modem and IBM's NetView.

vendors to write directly to NetView, instead of to the expensive NetView/PC. IBM has reportedly denied speculation that it will withdraw NetView/PC from the market.

Codex is offering a DualView Management Option to its 2000 Series line of modems that will let network managers interactively manage leased line modems by NetView and by Codex's own Network Management Systems concurrently. The 2000 Series modems — with an installed base of about 30,000, according to Codex — will compete head-to-head

with Qwest's new IBM's own Link Processor. Datacom's Link 2 (GPDSI) protocols is allowing Network managers to analyze, monitor, and collect 2000 series of high-speed

modems in Internet and local network environments. IBM's right now. Most businesses don't have to be Codex network management system to use this option. We have more interface integration (with View environment), customers will need to have the Codex," Ries said. Now, all NetView commands and Codex commands can be executed through a menu that is only using NetView (or) opens new channels and strengthens our target industry versions," Ries added.

However, the Codex protocol bypasses NetView/PC. IBM's recommended NetView route for third parties, thereby taking ground in the hottest high end of

NetView traffic. "A lot of users on the IBM side manage applications," Ries.

Because to manage modern business applications, you need both NetView and Codex Network Management Options.

NetView manages applications layer traffic through NetView at the same time as communications managers manage through the Codex system.

"This is a genuine step toward genuine multi-vendor

the modern market, one with the same mission: expand, before to "gain account control via NetView," said Codex product planner Robert Ries. Customers for whom NetView-based control is a prerequisite can now shop beyond IBM.

NetView's and Control Facility offer more features does. For example, for only one failure speed, while DualView's multiple failbacks, added functions provides are distributed alarms and store complex global network configurations.

View's rave reviews.

AND EVERYTHING WORKS
BEST WITH A CODEX 9800
NETWORK MANAGEMENT
SYSTEM.

DualView does more than let your modems talk directly with NetView. It lets you talk simultaneously to a Codex Integrated Network Management System that does a lot of things NetView can't, like predict problems and help

Meridian Data, Inc. has announced a family of compact disc/read-only memory (CD-ROM) networking systems that can simultaneously access up to 14 CD-ROM drives.

The CD Net series reportedly supports Novell, Inc.'s network software through the Novell IPX interface and can be hardware-configured to support EtherTalk, Arenet and Token-Ring networks. According to the company, the product connects to the local-area network like any other node and includes workstation management software that permits the user to selectively access any CD-ROM drive on the network.

Scheduled to ship this month, the product is priced from \$5,995 to \$16,545, depending on configuration.

Gateways, bridges, routers

Digital Communications Associates, Inc. has announced a software addition to its Series 300 family of wide-area network processors.

Langate/IP reportedly gives users the ability to interconnect between Transmission Control Protocol/Internet Protocol (TCP/IP) and X.25 networks. The gateway software module also features a data compression capability and is priced at \$4,995.

The firm has also introduced Lanserver/TCP, a terminal server that supports the TCP/IP networking protocol for Ethernet-based local-area networks; and SD Link, a synchronous Data Link Control software module designed to support SNA/Synchronous Data Link Control communications over a Series 300 WAN. Lanserver/TCP costs \$3,100, and SD Link carries a price of \$795. DCA
1000 Allderman Drive
Alpharetta, Ga. 30201
404-442-4521

Attachmate Corp. has revised its 3270 gateway software package to support modem-link speeds up to 64K bit/sec., the company said.

Release 1.3 of the Extra 3270 Gateway Option operates with ExtraWorks Local Software and reportedly utilizes the firm's recently announced Advanced Function SDLC Adapter to achieve increased speed performance. The product now permits data to multiplex with other data and voice over T1 links. The adapter incorporates an on-board coprocessor and memory, and an RS-232C connector and cable are included for direct connection capabilities.

The Extra Gateway Option allows as many as 128 Systems Network Architecture Logical Units to be active concurrently and is priced at \$50. The Advanced Function SDLC Adapter lists for \$1,195. Attachmate
13231 S.E. 36th St.
Bellevue, Wash. 98006
206-644-4010

Cisco Systems, Inc. has added X.25 packet-switching capabilities to its line of internetwork routers.

Starting in October, the X.25 packet-switching technology will be included free of charge in all routers shipped with X.25 protocol software, the company said. The software reportedly provides three functions: it allows a router to function as a pure X.25 packet switch; it permits multiple switches of the type to be interconnected via Transmission Control Protocol/Internet Protocol; and eliminates the need for a parallel X.25 network by allowing the user's wide area network to transport standard IP traffic from both networked computers and X.25 devices.

The X.25 software is priced from \$1,200.

WHAT DO YOU CALL THE TOP DOG IN THE COMPUTER RENTAL BUSINESS?

Since 1962, you could always call Leasomatic Data Communications, Inc. your company's best friend. You still can, but with an important difference. We've changed our name to Data Preference, which is much more descriptive of what we do. Because no matter what your preference in computer equipment for rent, lease, or purchase, Data Preference can create a complete package of products and services to meet your needs.

That's what makes us the top dog in the business—we have more personal computers, peripherals, and network products from more

vendors, than anyone else. More finance plans to meet your budget. And more service programs to keep you up and running. So, give Data Preference a call, and find out what the top dog in computer rental can do for you.

Leasomatic Data Communications, Inc. is now Data Preference.

MANAGER'S JOURNAL

EXECUTIVE TRACK

Commodity Exchange, Inc., (Cexcom), the New York-based market for trading in metals futures and options, has announced two promotions in its operations and systems department.

Jack Sebo was named vice-president of application systems. He was previously senior director of application systems, a position he held since 1968. In his new position, Sebo is responsible for systems analysis and design of new advanced trade processing systems. He joined Cexcom in 1960 as manager of programming.

Before Cexcom, Sebo was controller of computer operations at Intercontinental Hotels Corp. He holds a master's degree in sylogistic logic from the Gregorian Institute in Rome, Italy.

Berry Witt was promoted to vice-president of database systems in the Comshare data center. He was previously director of design systems, a position he held since 1965.

Witt joined Comshare as an independent consultant in 1963. Before Comshare, he worked at The Dan & Bradstreet Corp., as a project manager and was later responsible for organizing and staffing the information center. He began his career at Mutual Insurance Rating Corp.

Witt holds master's and bachelor's degrees in business administration from Baruch School — City College of New York.

Who's on the go?

Changing jobs? Promoting an assistant? Your peers want to know who is coming and going, and Computerworld wants to help by mentioning any IS job changes in Executive Track. When you have news about staff changes, be sure to drop a note and photo or have your public relations department write to Clinton Wilder, Senior Editor, Management, Computerworld, Box 9171, 375 Concourse Road, Framingham, Mass. 01701-9171.

An unvarnished view of IS efficacy

MIT's Thurow takes aim at the lack of payoff from computerized office

The Dean of MIT's Sloan School of Management and an economist with extensive research on the lack of U.S. economic competitiveness, Lester C. Thurow brings an uncommon perspective to information systems management. Thurow sees computers being applied to outdated procedures and generating unnecessary information, and he notes the lack of a bottom-line orientation on the part of IS managers. Computerworld Senior Writer David Liddleman recently spoke with Thurow about the role of IS and the individual manager.

As an economist, do you see any trends underlying the current difficulties in the computer industry?

One of the problems you've got is that every market eventually becomes saturated.

Point two is that computerizing the office just hasn't paid off in terms of bottom-line productivity. For it to do so, you would expect to see white-collar employment growing more slowly than output. In fact, the number of white-collar employees has grown much faster than output, which means we have fallen in productivity among white-collar workers at the same time we're putting all this investment into computerizing the office.

It's true to say it, but it is really is true: To computerize the office, you have to reorient the office in terms of who reports to whom; what reports are generated — all those kinds of things. But ripping up the office and inventing a new office is sociologically very difficult, because you interfere with power arrangements, and you in-

MIT's Thurow: "Only in the abstract do we live to change."

terferes with established customs and procedures.

Could this just be a transitional phase?

Maybe, but it's been a long time. And the interesting thing is that neither the Japanese nor the Europeans have computerized anywhere near as fast as we have, yet their overall productivity and service productivity is rising much faster than ours is. So if you just looked at the objective data, you'd say using

computers is a mistake. Now, I don't think it is a mistake because you can see these amazing things that people can do, but if you just do amazing new things and end up layering the system like we've done, if you were making a hard-nosed business decision I think you wouldn't have invested in as many.

What are the repercussions for IS organizations?
A lot of frustration, because the CEO

GAO Hall of Shame cites techno-lemons

BY MITCH BETTS
CW STAFF

Most of the talk at the Federal Computer Conference in Washington, D.C., last month was about the wonders of technology. But, in the U.S. General Accounting Office (GAO) put a stop to that.

The GAO is the congressional watchdog agency known for its harsh critiques of federal information systems. For many agency executives undergoing a GAO audit is on par with getting a root canal.

A conference presentation by Ross B. Stilman, chief scientist at the GAO's Information Management Technology Division, accoladed federal

IS executives for worshipping technology as the center of the world and viewing the agency and its mission as merely a "convenient context for developing technology."

Stilman emphasized that technology only exists to support the agency's mission and "has absolutely no intrinsic value otherwise."

Typically, IS departments upgrade their systems without ever considering whether it helps the agency accomplish its mission better, not just faster. Then, she got tough.

Stilman cited three general examples from what she called the GAO Hall of Shame:

• An agency planned to upgrade systems to keep up with the work load, but customers said that most of the generated reports were useless and thrown

in the trash. "What we see is not a system that is too small to process the work load. We see a work load that hasn't been analyzed and much of which doesn't have to be done at all," Stilman said.

• Some officials upgrade centralized operations without considering any other options. "One agency spent a great deal of money to replace the big message center with a big message center." The agency considered the concept of "eliminating the message center" and using electronic mail for direct transmissions instead, she said.

• Many agencies have exciting strategic plans for providing better services, but their technology plans bear no relationship whatsoever to the strategic goals of the agencies. "All we see in the technology plans are plans to buy new stuff to do the same wrong thing faster," Stilman explained.

Bull has been with UNIX® operating systems from the beginning. As a charter sponsor of X-Open and an active participant in OSF, we're proud to introduce a brand new line of UNIX multi-user systems to our portfolio of proven UNIX solutions.

Now the Bull DPX/2 is ready to take UNIX operating systems into the future starting with the applications of today, including ORACLE, WordPerfect, Uniplex and INFORMIX.

Even our existing GCOS 6 customers can tap the

enormous advantages of the new open systems technology with our new peer processor. It can open you up to UNIX systems solutions.

Either way, you'll find the networking expertise and the worldwide product service and resources of a \$5 billion global giant behind you from the beginning.

Know Bull.

FROM PAGE 87

says to the CIO, "I've given you a lot of money; why isn't it paying off?"

Does that have something to do with the rate of which CIOs and VPs of information systems seem

to come and go firms?
That reflects two things. It reflects frustration with the lack of payoff, but it's also probably like the chief of human resources development — it's a little bit of a dead-end job. Because if you look at who becomes CEO, there are certain second-level jobs that never lead you to the first-level job. People regard the job of chief information officer as too

specialized a set of experiences to qualify you to actually run the company.

I think there's probably frustration on the part of those people too, because they get up to a certain level and they can't be promoted.

Information systems are playing an increasing role in corporations. Do you think that will change

things — that CIOs will become more eligible for the top job?

I would suspect not. You don't get a chance to get to the top unless you've actually done some line management. Information systems is a staff function. You can make an argument that we've already got too many [top executives] coming out of staff functions.

So your view of the CIO's prospects isn't particularly positive?

Getting up to the second level of the company is a good career. Most people don't make it that far. If you could really make the whole thing pay off in terms of productivity, I suspect whoever does that is going to find it opens up lots of avenues — higher jobs than director of information services or VP of information services.

Do you have any thoughts on how someone might pursue that direction?

It really requires structural changes in the way we do things. The problem with information services is that it's so easy to generate data and things. Each bit of data is cheap that we tend to generate millions of bits, and then it ends up being horribly expensive.

Thinking seriously about what we need and what we don't need — with the emphasis on what we don't need — is the way to go, because clearly you can do remarkable things with this technology; the question is how to keep it from burning up resources when it isn't doing remarkable things.

Do you see significant changes in the way information technology is going to be used by U.S. businesses as we move into the 21st century?

The way it is used is going to have to change. The investments are just too large to let them sit there in a nonproductive way. It isn't at all clear at the moment how they're going to change, but the fact that they will change I think is 100% assured, because sooner or later frustration leads to action.

Can you give an example?
Take banks. It's hard to believe, but if you look at the statistics, it would seem that processing checks by hand is just as efficient as processing checks by computer. The reason is that we won't go all the way and do electronic banking, where you give up checks.

The problem with checks is that somebody has to hand-read every check to verify the amount that the check is written for. That completely vitiates the computer system. The Europeans are shifting to electronic banking, where you just have a card. Then you can make your computer system in banking pay off.

The problem in the U.S. is twofold. One, the merchants don't want to buy the equipment to do electronic banking.

Two, individuals are reluctant to give up checks and have instant debts. The second thing can be solved if the banks agree not to deduct it for three days. But of course part of the produc-

for people with a lot to store, and not much time
to process it. The system has the highest capacity
and the highest transfer and access rates.**

If your business needs to store and retrieve significant amounts of image-intensive or alphanumeric data, specify the KODAK Optical Disk System 6800.

It offers unparalleled storage capacity, flexibility and speed, in the smallest footprint per megabyte available today. The KODAK Automated Disk Library can put you on-line to over one terabyte—that's 1000 gigabytes—of stored data in just 6.5 seconds. Available in several configurations, the library requires as little as 13 square feet of floor space.

Additionally, the KODAK Optical Storage Interface can connect the system to a wide range of minicomputers or IBM® mainframe host environments.

For a complete package of information, call 1-800-445-6325, Ext. 993A. Visit us at Comdex Booth 2716.

We're looking for systems integrators.

SO MUCH DATA, SO LITTLE TIME. CALL KODAK

tivity, as far as the banks are concerned, is that you can deduct it instantly.

It's not that it's physically impossible to make it pay off, but it means you have to change habits.

Banks aren't used to the idea that they have to buy equipment to put in the local department store. But that's the place to put equipment that will make the bank more efficient.

You've noted that the Europeans have bought fewer computers than Americans and their office productivity is growing faster. Have they pursued a course that is more appropriate?

Not by choice. They probably were just laggards, but being a laggard proved to be the thing to be, which is often the case. Innovators don't always win, because they make a lot of mistakes and incur a lot of expenses. If you wait, you can see the right way to do it and not incur all of the expenses of making these mistakes.

How would you size up the situation in Japan?

If you looked at usage, you wouldn't say they're pioneers. They've in some sense lagged

gards. What contributed to Japanese productivity in the last decade has not come out of computer technology, so I don't think you would say the Japanese have been big leaders in getting productivity out of computer systems.

Has that been a conscious direction?

No, I think it's just flowed out of the fact that because of the Japanese language, they had no formalized accounting system. You can't really do Japanese word processing. It is possible, but it's very slow. And so this huge purchasing of computers for word processing hasn't occurred.

You said it isn't clear how we can relevance the business, but are there steps someone might take toward doing so?

Part of applying computers is knowing when not to use them. For example, take inventory control. It is possible to design a very sophisticated computerized inventory control system. But we know it's damned inefficient. The efficient way to do inventory control is to have an in-timer inventory, so that the workers on the line do it, and you don't have computer systems at all. Just in-time inventory requires

bosses who are willing to trust their workers to do a good job, because the bosses will not know what the inventory situation is.

I think Americans think that more information is always better than less information. And since information costs money to get, it isn't true. My impression is that most universities and most companies carry enormous

books every night?

Anything similar in the marketing area?

Well, I worry about supermarkets. With these electronic checkouts, the stores are generating huge amounts of information. The idea is that all this information can be used to create better sales and marketing. The

is that an information officer would have to have a lot more clout to reorganize the firm than they do in fact have. To make information technology pay off, you're going to have to involve a lot of people other than information systems people. The rest of the world will let you automate what they're doing, but they won't let you change what they're doing.

In order to make it efficient, you have to change what they're doing.

Does the chief information officer have that kind of clout?

No. He never has that kind of clout. Not even the CEO has that clout. I mean the CEO technically has that kind of clout, but [foot it] you get revolt in the ranks and the revolt is so extreme that it is disturbing the system.

It sounds like that might involve issues that prospective information systems professionals would not anticipate in school.

Most people who are students don't realize how difficult it is to change their behavior. It's partly because human beings lie. We say we love to change, in fact we refuse to change. Only in the abstract do we love to change.

T HE REST OF THE world will let you automate what they're doing, but they won't let you change what they're doing.

LESTER THURROW
MIT'S SLOAN SCHOOL

amounts of information that has no positive value whatsoever. They more or less keep records for the sake of keeping records just in case they might need them.

Can you point to other examples of computers being used ineffectively, perhaps finance or marketing?

Double-entry bookkeeping. With the advent of computers, many companies close their books every night. What the hell do you learn by closing your

question is, how much of it will be? I don't know, but I'm skeptical every time I walk through a checkout.

So, for starters, we have some information management problem.

We certainly have that. But it is a lot more than information management. If you change information, you change power relationships and sociology inside a firm. If you change information flow, you change who reports to whom.

So, I think part of the problem

I=U!i' v+t| P+=zP+=z P+

"Why pay more for a climbing rope? If it breaks, we'll give you a new one free."

It's easy to cut costs by cutting corners. But if you lose critical data, it's gone for good. When it's your business that's on the line, don't take chances with anything less than Dysan 100 flexible disks. We test 100% of our disks and certify 100% to be 100% error free over 100% of the disk surface.

The Dysan 100. It's not just a name. It's a measure of superiority.

Dysan 100
100% Better

There's a slight gap between the truth and what the major database vendors would like you to believe.

Even a minor "discrepancy" in a database vendor's promises can wind up stopping you dead in your tracks. Because when a product can't live up to its claims, you've got an unbridgeable problem.

Consider this, then. They say that their databases are "distributed." But can they store data everywhere in your mixed-platform network—and read and update from any node? Interbase can. They say they're fast. But do they achieve performance beyond elementary TPI benchmarks? Interbase does.

They say they're right for the times. But were they designed for the complex database networks of the '90s? Interbase is.

At Interbase, we're not interested in misleading you. We're interested in your application working the way you thought it would.

No surprises. No gaps.

Status quo must go, MIT's Treacy says

By MARYFRAN JOHNSON
OF STAFF

BOSTON — Michael E. Treacy bears no glad tidings for the status quo at corporate headquarters.

Given enough money invested in current computer systems? Prepare to trash it all, the information systems consultant and MIT professor told a recent gathering of John Hancock Insurance Co. managers.

"What we have now won't get us to where we want to be in the mid-1990s," Treacy said of Hancock's 30-year investment in systems and applications. "The key is a fundamental shift in thinking about how to be successful with technology."

Treacy was the star attraction at Hancock's fourth annual Technology Awareness Event on Oct. 31 and Nov. 1, which filled the company concourse with exhibits from vendors displaying workplace technology both present and future. Some 800 company executives, managers and employees attended.

Along with Treacy's unsettling message, his appearance at the Hancock meeting bore just a touch of radical chic. He wore a wild green and black striped bowtie that drew the eye away from his sober business suit.

Treacy's background includes a doctorate in MIS from MIT's Sloan School of Management, consulting work with Index Group, Inc., in Cambridge, Mass., and the recent establishment of his own Cambridge-based firm, Treacy and Associates.

At a breakfast meeting with 70 top business managers at Hancock, and later

in meetings with the company's IS staff, the consultant hammered home the message that the most successful companies will be those whose high-tech investment is driven by business managers—not IS professionals.

Yet, Treacy stressed, IS retains a crucial role as well. Directing the shift in corporate thinking about technology may come from "IS professionals transitioning into a business role, bringing a fresh and very different perspective," he said.

"Don't make the mistake of thinking you're moving ahead just fine," he said. "Incremental innovation is a disaster. It allows us to think we're doing good while we're dying slowly."

One company should plan to spend 10% to 20% of new dollars on research and development in systems applications, he said.

The next five to eight years will be a watershed period for many companies, whose survival will depend on using technology to create enterprising ways of operating the business. "Major damage" will be done, Treacy noted, by upstart firms and savvy competitors willing to break rules and innovate more quickly.

At Hancock, for example, the Filmset Image Processing system from Wang Laboratories, Inc. is in use in the group pensions department for claims process-

ing and retirement benefits.

"Imaging is eventually going to become a major form for paper-intensive industries like this one," Treacy said. "But there is no advantage to automating existing business processes with it. The key is finding applications for it that transform the business."

Organizations that have faced up to the issue of their survival can be "incredibly innovative" in changing their business culture, he said, pointing to Xerox Corp. as an example. He noted how Xerox "revolutionized" its own methods of designing and manufacturing copiers when competition from Canon came snapping at its heels.

Companywide integration and systems coordination is another key to improving customer service and guaranteeing success, he said. Cincinnati-based Procter & Gamble, Inc., he noted, pulled together under the umbrella of "product delivery" three formerly separate functions covering suppliers, manufacturers and finished-goods delivery.

"Fundamental innovation is revolutionary. You've got to be willing to throw stuff away. It's very very painful," he said, suggesting that Hancock will "systematically throw away" \$1 billion in technology over the next decade.

"Most IS people have a good sense of what needs to be done," he said. "I just confirm their thinking."

A 5-step plan for IS execs

To jump start your management executives and more quickly drive information technology innovations into practice, our consultant and MIT professor Michael Treacy offers a five-point plan for information systems executives to follow:

- Present management with a strong case for action backed up with a solid business plan, financing and strategic analysis.

- Secure and sustain intensive top-down pressure from the chief executive officer, but let midlevel managers work out the specifics.

- Provide opportunities for bottom-up involvement, giving employees a sense of ownership in the plan. Run the plan as if it were a political campaign, with a sustained, consistent message.

- Set up milestones by which to measure progress and fuel a sense of urgency. Plan to show concrete results within three years.

- Determine to remove all of the laggards and the naysayers of the plan.

Presents

Graphics & Image

The Next Revolution

Attend IDC's Graphics & Image: The Next Revolution for a bottom-line oriented analysis of the products and strategies that will drive the use of image and graphics in the applications of the '90s. IDC's technology experts

will answer questions of how to manage the technologies / products, when to implement them, and who has the steak versus who has the sizzle. The primary focus of the sessions will be oriented toward customers and their issues in this new field.

THE PROGRAM

Graphics & Image - An Information Revolution

Aaron C. Goldberg, Vice President, Workstation Research, IDC
PC Hardware and Applications for Graphics

Joan-Carol Brigham, Program Director, PC Graphics and

Expansion Products, IDC

The Role of Graphic User Interfaces

Nancy McSherry, Program Manager, PC Software, IDC

Image and the Office System

Ann Palermo, Program Director, Integrated Office Systems, IDC

The Role of the Macintosh

Abigail Christopher, Program Manager, Macintosh Market, IDC

Low End Displays

Eileen O'Brien, Program Manager, Terminals, IDC

Image Storage

Jay Bretzman, Senior Analyst, Storage, IDC

Outlook for Image

TBA, Program Director, Image Systems, IDC

December 7, 1989

Santa Clara Marriott
Santa Clara, CA

YOU WILL LEARN

- ◆ How far along your colleagues are in adopting and using graphics hardware and software products.
- ◆ How soon, and why, they plan to upgrade to higher resolution and/or color.
- ◆ Where image applications are most effective.
- ◆ Key supplier's product strategies.
- ◆ How far presentation graphics software and desktop publishing software have penetrated the PC user community.
- ◆ Cost-saving alternatives to a PC on every desk.
- ◆ Which graphic and image applications provide the best return on investment.

WHO WILL ATTEND

Office Automation Managers, Information Center Managers, Application Development staff, and those responsible for their organization's graphic & image strategies.

Vendors interested in their clients' wants and needs, and their competition's answers.

REGISTER EARLY!

Attendance is limited and this session is expected to fill quickly. To avoid disappointment, reserve your place today. Contact Kathy Collins at (800) 343-4952, extension 4258. In Massachusetts call (508) 935-4258. Registration Fee - \$395.

BOOK REVIEW

The anxieties within today's onslaught of modern information**INFORMATION ANXIETY**

By Richard Saul Wurman
Downesday, \$19.95

In the movie *Dead Poets Society*, the preparatory school teacher played by Robin Williams shocks his students by standing on top of his desk and exhorting them to do the same. His lesson is simple: It is time to step outside your traditional perspective and look at the world in a new way.

As U.S. businesses approach the challenges of the 1990s, that lesson is a critical one for IS executives and their general business constituents. In *Information Anxiety*, Saul Wurman's unusual and thought-provoking book *Information Anxiety* is a very good tool to help achieve that kind of new perspective on the phenomena that drives our economy and our society: information.

What is information? How is it conveyed among individuals, passed on by teachers, shared among business executives, absorbed by newspaper readers or television viewers? And why do so many of those information exchanges fall short of their goal of bridging the gap between information and understanding? These are among the questions that Wurman places on the table for his readers to ponder.

Originally trained as an architect and designer, Wurman has more recently written several books that redesign reference sources—Yellow Pages, travel guidebooks, maps—and present their traditional information in a more accessible form. Opening *Information Anxiety* with the statement that "books are a major source of information anxiety," Wurman proceeds to reconfigure the conventional parameters of book writing and—even more importantly—book reading.

He encourages readers not to proceed sequentially from beginning to end, but to browse, enjoy and absorb. He combines the unconventional formats with unconventional insights.

The initial premise contained in Wurman's title is not a particularly new one—that the daily barrage of information, which most people face, is often more of a curse than a blessing. A single weekday edition of *The New York Times*, he claims out, contains more information than a typical 17th century Englishman was likely to encounter in a lifetime.

Much of all this extra information is less than user-friendly, however, creating the condition of anxiety. You know the information is available, but you find it very difficult to get at it in a way that is easy to comprehend.

In a breezy and conversational style spiced with humor to drive points home, he dissects virtually every vehicle of information you can think of—instruction manuals, conversations, television news, USA Today color graphics, corporate memos. An added bonus is the margin of

livier oil, which Wurman annotates with relevant facts, anecdotes and quotes. You'll find unexpected sources like Alvin Toffler or Marshall McLuhan alongside Einstein, Marcel Proust or Tom Robbins.

Wurman is particularly on target in a chapter on the topic that should be foremost in the minds of anyone who cares about the future of U.S. business and society: education. He argues that our current system encourages students to fear rather than embrace learning — to regard it as something like cod liver oil, "something that might taste pretty bad but may do some good in the long run." The educational system ultimately produces information anxiety because it causes students to feel intimidated by what they do not understand.

Wurman advocates less testing of

facts and more training in how to deal with information by questioning, thinking and not fearing. This is the lesson that U.S. business should heed.

If you perceive that your primary job is to keep computers running, you will not find *Information Anxiety* very relevant to your work. However, if your job involves managing the flow, delivery and destination of information within your organization, this book should provide valuable new insight into how to do that better. It is orders-of-magnitude more fun than a technical manual on database design—and arguably much more relevant to the real mission of the IS executive.

CLINTON WILDER

Wilder is Computerworld's senior editor, management.

Premier 100 winners feted at awards dinner

MCI takes top prize for excellence in information systems use among various industries

If the *Computerworld* criteria for rating the effective use of information systems could sing, their tune in 1989 would ring out, "I like my MCI."

The spotlight was turned on MCI Communications Corp., ranked No. 1 in the second annual *Computerworld Premier 100*, at a recent awards dinner in New York honoring the most effective users of IS. And one executive who never shies from the spotlight, colorful MCI Chairman William G. McGowan, was on hand to accept the first-place award.

McGowan was accompanied at the presentation by two IS executives, Senior Vice-President Allan Ditchfield and Executive Vice-President Dick Liebhaber.

Presenting the awards were Patrick J. McNealy, chairman of International Data Group, as well as *Computerworld* President Fred Lassmann, Editor-in-Chief Bill Lehrer and Senior Editor Michael Sullivan-Trainer.

IS executives present to receive the awards were Dennis Murphy, director of GTE Corp., who was ranked No. 2; Thomas Kierman, president of the Sabre Computer Services division of AMR Corp., No. 3; Carmine Vena, executive vice-president of Bankers Trust; No. 4; and Ron Cybysie, senior vice-president of Banc One Corp., No. 5.

Also on hand to accept awards were

Computerworld Premier 100 award winners gather. MCI Corp. Chairman William G. McGowan, center, represented his top-ranked firm

Ken Wang, director of General Dynamics Corp., which earned a No. 6 ranking; John Hansen Peters, a vice-president at the New York office of Security Pacific Corp., No. 8; Michael S. Heschel, corporate vice-president of Baxter Healthcare Corp., No. 9; and Herbert W. Moller, vice-president, and Ted Stadish, director, of Gillette Corp., No. 10. Contel Corp. was ranked No. 9.

Following the presentation of the awards, keynote speaker Lester Thurow, dean of MIT's Sloan School of Management, warned of serious consequences for the U.S.' economic position if the nation fails to solve its education crisis.

"A parachute's a parachute. Here's one that will save you big money."

WHAT'S GOTTEN INTO THEM?

EMC's 3090 Central and Expanded Storage.

EMC Corporation makes more powerful computer systems — even though we don't make computer systems at all. Instead, EMC turns the processing potential of existing CPU's into measurable gains in system throughput, people productivity and corporate profits. Which is exactly why more than 75% of the Fortune 500 have not only called our number — they've installed our products.

What kind of products? Products like EMC's 3090 central and expanded storage, which maximize utilization of system resources ... which offer more configuration choices to match your applications more exactly ...

and which are comprehensively supported by EMC's worldwide sales and service organization.

EMC specializes in storage architecture — in moving data more rapidly, reliably and cost-effectively from where it's stored to where it's needed. That focus has made us an integral part of more than 1,500 IBM mainframe sites. And it has made our 3090 upgrades the right choice for companies that want to get a more powerful computer — without getting a new one.

Beware, IS: PC gurus are here to stay

Desktop management requires new spirit of cooperation

BY AMIEL KORNEL

At Amoco Corp.'s research center near Chicago, engineers and scientists jealously guard their autonomy in desktop computing. As they develop new products and processes for the oil company, they tolerate little interference from information systems people or anyone else.

"In a research environment, you run up against something called ego and creativity," says end-user support supervisor Mike Kuchae. "They don't want any restraints whatsoever. And that makes support a living hell."

The clash between desktop libertarians and information systems authoritarians is not unique to the research environment. Common to most organizations ever since personal computers began proliferating in the corporate world, the conflict has left the management of end-user computing in a state of disarray.

However, a new bipartisan approach to the politically charged issue is in the making. IS managers and end users are smoothing over their differences and engaging in a new alliance that could give IS greater influence over personal computer management.

At the heart of the new alliance are highly proficient end users — variously called mavericks, outlaws or gurus — who have been leading the ragtag troops of desktop computing.

"The mavericks have much more power than they realize," says IS consultant Amy Wohl in Bala Cynwyd, Pa. "They're the only ones to know both the business and the technologies. In their area of competence, they're more knowledgeable than the IS staff."

Corporate executives are starting to recognize that PC paras have been fulfilling an ad hoc role as IS surrogates for some time. To the surprise of many, they are learning that the underground activity of those people has been largely beneficial to the organization.

"They are at least equal to, if not better than, IS

Why settle for a single player,

when you can have the whole orchestra?

IBM Interleaf Publisher. The desktop publishing ensemble that does it all.

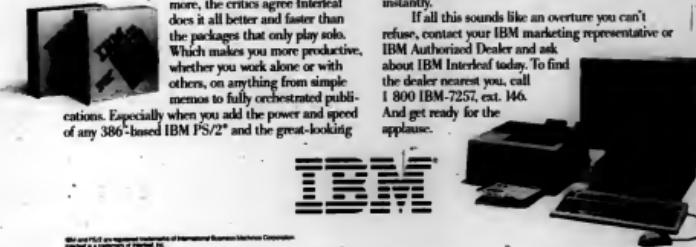

Until now, most desktop publishing software played only one tune. Some performed page layouts. Others executed graphics. Then there were the word processing virtuosos. And the charting soloists.

But now there's IBM Interleaf® Publisher. It performs *all* these functions, and makes them work together in concert. So all you need is one desktop publishing instrument to do the work of many. What's more, the critics agree Interleaf does it all better and faster than the packages that only play solo. Which makes you more productive, whether you work alone or with others, on anything from simple memos to fully orchestrated publications. Especially when you add the power and speed of any 386®-based IBM PS/2® and the great-looking

results you get with an IBM LaserWriter.

Pop-up menus that let anyone play like a pro. Practice, practice, practice? Not with IBM Interleaf. Its pop-up menus lead you through any task. Too. You're free to improvise. Create. Even show off a little. And if you want to change your tune, that's easy, too. Start with a spreadsheet, and transform it into a pie chart, then to a bar chart, then to a line graph—instantly.

If all this sounds like an overture you can't refuse, contact your IBM marketing representative or IBM Authorized Dealer and ask about IBM Interleaf today. To find the dealer nearest you, call 1 800 IBM-7257, ext. 146. And get ready for the applause.

in satisfying end-user needs," says Harvey Shrednick, vice-president of information services at Corning, Inc. in Corning, N.Y.

Given the growing sophistication of PC users in general, the changing role of technical users could bring further changes to come. At many major companies, chief information officers are already telling their IS staffs to enlist users when defining overall strategy.

"We're trying to make sure that the user is heavily involved [in planning] so that our vision is implemented," said Max Hopper, senior vice-president of IS at American Airlines, while attending the recent Info '89 conference.

At the same time, workers' increasing computer literacy is leading many of them to demand more IS involvement on the desktop. Brian Williamson, personal computer services manager at First Source, National Bank in Lexington, Ky., says IS is facing a "budgetary" because of "a tremendous pent-up demand for applications."

The IS pull

End users' growing need to communicate with colleagues and connect to host databases is pushing them into the arms of IS. And the ever-growing variety and complexity of applications are sending users back to IS clamoring for improved training and support.

At Houston-based M.W. Kellogg, for example, more than half of the engineering firm's 2,800 headquarters staff are technical survey engineers. An interviewee revealed recently that the company's training program lags behind the demands of users, says Linda Stettbacher, manager of planning and office automation.

"We plan to start a program on self-instruction by the end of the year to leverage our instructors and reach a wider audience," she says.

SOME OF MY HIGHLY TECHNICAL IS people fear that some of their ideas are going to be overruled by the more vocal power users."

puling was happening on the desktop. Users who were crying out for business solutions that IS was unable or unwilling to deliver turned elsewhere for support.

Now, information systems managers are confronting the painful realization that their grip on corporate computing has been weakened by end users' continuing control of the desktop.

"With more of the computing in a company being done by end users, the proportion that IS has any control over is shrinking," says Evelyn Arkush, vice-president at Index Group, Inc. in Cambridge, Mass.

Even IS departments that in the past kept close watch over end users are discovering they now have less influence.

Williamson, for example, thought he'd been spared many of the headaches dogging PC

independent-minded cows in Williamson's own IS barn, however, seem to be edging out of their stalls. "As users get more sophisticated, they don't feel much guilt about branching out on their own," he acknowledges, before adding, somewhat perplexed, "Despite the fact that we always have been very conservative, we still have these users."

Like Williamson, many IS professionals are discovering that their authority over end-user computing is tenuous at best. "We really do not have control of our user base and we never have," says Carol Hartwig, who until recently was manager of IS support at Corning.

In an effort to mend its relationship with the end-user community while acquiring greater influence in defining future directions of PC use, IS is turning to PC guru. "Some companies

pursue the new alliance, IS managers at Corning and other companies worry about encountering resistance from IS staff. "Our users tend to accept change easier than our DP folk do," Hopper says.

addressing on the desktop are many. Data security and integrity have been largely neglected by end users, they complain, while ensuring systems compatibility has become a nightmare.

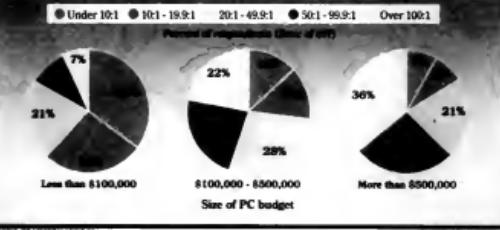

At Amoco's research center,

MY EXPERIENCE is that although a lot of IS people can intellectually analyze the value of end-user computing, deep down inside, they think it's awful."

EVELYN ARKUSH

IS turns to PC gurus

Larger firms are more likely to have higher ratios of users to PC support staff than smaller firms

managers at other companies, thesis to the bank a centralized approach to managing the desktop.

That approach, Williamson says, has enabled him to head off connectivity problems by insisting that the bank's 250 PCs be IBM-compatible. Other institutions, be notes, looked the other way while individual workers and

are getting smart and seeing that's the person they need to sign up," Wohl says.

Corning, frustrated by end users' growing demands, earlier this year surveyed employees who used the company's installed base of 6,000 PCs and workstations. "We couldn't afford to supply the hungry appetites of those end users out there," Shrednick says. "As applications grow, hand-holding and training needs grow, and I couldn't keep throwing bodies at them."

From the survey results,

Shrednick realized that end users were turning to decentralized guru as well as IS for support. Rather than trying to diminish the guru's ad hoc role, he decided to test shifting more formal responsibility to them, making central IS "the last recourse" for support.

A pilot trial in one business unit, completed in October, was highly successful. "Users and IS people were quite amazed by the amount of productivity improvements," Hartwig says. Corning IS managers are currently evaluating if and how the program could be extended throughout the company.

That may not be easy. As they

are getting smart and seeing that's the person they need to sign up," Wohl says.

That may not be easy. As they

departments, paying scant attention to compatibility issues, installed whatever hardware and software they preferred to solve their business needs. Now, though, some organizations are painfully trying to impose standard policies of information systems procurement and management on recalcitrant end users.

"That's like trying to close the barn door after the proverbial cow is already out to pasture," Williamson says.

It is no secret that IS — and some major computer vendors — once thought the PC was an aberration that would just go away if they ignored it. But millions of workers in offices, factories and laboratories are the new tool as a way to increase their autonomy and effectiveness.

The transparent walls of the glass house seemed to turn opaque as IS refused to see that more and more corporate com-

puter managers at Corning and other companies worry about encountering resistance from IS staff. "Our users tend to accept change easier than our DP folk do," Hopper says.

At the heart of the issue is a cultural divide that could prove

the presence of dozens of incompatible machines among the site's 720 PCs inevitably poses connectivity problems for Corning's 12-person support staff.

"Users go out and buy esoteric platforms because it solves a specific need. And then, six months down the line, when they want to send data somewhere, they merge it with something else, that's it. So we have to go around creating black boxes" that interconnect disparate hardware, Kuchae says.

Virus worries
Widespread micro-to-mainframe interconnectedness at Amoco also has worried about security. "There are a bunch of viruses out there just waiting to get in," he says — some from unknowing end users who may have picked them up when copying software from a colleague at an academic institution.

Data security and integrity are also important issues at First Security National Bank. Williamson, an IS consultant in Chicago, says 20 years of accumulated hostility between IS professionals and the end-user community.

Their training and experience has isolated IS professionals with values stressing the importance of using a systematic and structured approach to managing a company's computer and communications resources. Adequate backup, documentation, security and careful planning and analysis are essential virtues in their universe.

The spreadsheet
End-user computing is the antithesis of all that," Arkush says. "They think it's wrong; that it hurts the company, that it's irresponsible. My experience is that although a lot of IS people can intellectualize about the value of end-user computing, deep down inside, they think it's awful."

"It's just difficult to sit back and watch users make mistakes that people in data processing learned from decades ago," Williamson says, "and not to worry about what that means to my institution."

From IS management's point of view, the problems that need

Vendors shift attention to end users

BY AMIEL KORNEL

A vendor can no longer live by IS alone. Personal computer hardware and software companies are eagerly courting corporate end users who can help them define their product development and marketing strategies.

Listening only to the needs of IS, analysts say, has not always led marketers down the best path. "Vendors are beginning to find that all of the staff coming from IS is very skewed," says Jerry Schneider, a Washington, D.C.-based consultant in end-user computing and marketing. "A lot of planning has stressed mainframe usage. There are a lot more attempts by these companies to reach and talk to end users to set their directions," Schneider adds.

Some industry executives say that the industry is trying to draw users into their plan. They point to trade shows and user groups as forums in which their companies try to

plumb the needs of end users. They also say it is not uncommon for IS managers making visits for product demos to bring along a power user from their organization.

Executives agree that power users play a significant role in determining the course of desk-top computing.

"They represent a minority," says Rob Dickerson, vice-president of product management at Boraland International, "but they are a very vocal minority. They influence the IS manager, and they also influence product direction."

This message is not new for Apple Computer, Inc., which owes much of its success to the fact that its non-IBM-compatible computers have long emphasized end users' right to be different, much to the annoyance of many IS professionals.

"Our success is in our design point — and that is the individual," says Allan Loren, president of Apple's U.S. operations.

Even now, as Apple concentrates more on penetrating large corporate accounts, its end-user focus remains firmly entrenched in its marketing orientation, Loren says. "We see the individual becoming more and more influential and more and more powerful," he adds.

Not all vendors see the balance of power in corporate computing leaning even further into the end-user camp.

"I think the pendulum is swinging back toward MIS," says Rod Camm, president and chief executive officer of Computer Corp., "but it's going to stop somewhere in the middle. Each side is understand-

ing realistically that they have to work together."

"There really is no issue of managing PCs without support from MIS," says William O. Grabe, IBM vice-president and assistant general manager of marketing. "Since both entities . . . should work together for common goals."

Cannister sees users' need for greater interconnectivity with colleagues and host systems as key to driving them back into the IS camp. "It's no longer an individual person or an individual PC," he says. "It's really a group trying to work together."

Mike Maples, vice-president of applications at Microsoft Corp., believes that technology will allow companies to reconcile the sometimes conflicting priorities of end users and IS. He points to graphical

user interfaces, common user access and multilevel local-area network-based architectures as key bridges between IS and end users.

These technologies, Maples says, will afford workers "the impression of availability and discretionary use" of end-user computing tools, while providing IS a more effective mechanism for managing corporate information.

Grabe says IBM is trying to do just that with its Systems Application Architecture. "The single PC user still had the independence of action that he or she has always had, within a resource and standards envelope that encourages them to work with others," Grabe says.

These innovations won't necessarily make IS' role any easier, industry executives warn. "Even if the software vendors do a terrific job," Dickerson says, "it's not going to simplify life for the IS manager. The complexity of the data flow going on behind the scenes is going to go up and up and up. And the complexity of the connectivity issues is going to grow." *

Unlocking mainframe resources: spreadsheets

Why should you be in a crunch just because your end users need numbers yesterday?

Your overworked DP staff can't always download end user spreadsheet data fast enough to meet the demand.

But now there's a way out of the numbers crunch: the Trax Electronic Spreadsheet (ESS®). It makes file downloading a snap of the fingers by giving end users direct, controlled access to spreadsheet data from your IBM mainframe.

ESS is the key. ESS spreadsheets are limited only by mainframe capacity. Windows let end users view data in just about any combination. There's online help, 3-D spreadsheets, integration of PC spreadsheet data, even macro processing.

And anyone who knows the more popular PC spreadsheet packages already knows ESS. For real flexibility, use ESS with EdWord™, the Trax word processing program, to integrate numbers and text.

Trax is the key. Join the more than 500 companies using Trax products around the world. Contact Tom Cox, 10801 National Blvd., Los Angeles, CA 90064, FAX: (213) 470-2487. Telex: 350048. Telephone: (213) 475-TRAX.

and their needs, at looking at how their business worked. In planning and in many other areas, there are a lot of creative people who would be given a task, and if it didn't fit in with the standard way the majority of IS people worked, they would either have to go along with an existing standard or they'd have to push the frontier. We weren't really given a lot of help in pushing the frontier, in looking at alternatives. So it forced a few people to become technical. And, of course, the PC came along. It allowed us more alternatives. But we weren't given a lot of support.

Many IS people see connectivity as the reason — and the excuse — to regain control over what's happening on the desktop. That's true. There is still the thinking that the mainframe system is the only reason for being, and if you want a PC, it has to be hooked up to the mainframe. Most [IS] people can't even understand why you would need a stand-alone. With some creative end users who can work with the PCs and put things together, who have a business knowledge and also a technical knowledge of the PCs, we can address the different [business] scenarios and put together information that management can use in a more responsive way.

Until now, how well have the IS people in your company understood your business needs?

I don't think they have a very good knowledge of our business needs. Hopefully, this

and IS professional to bridge the gap

Dudley Henderson is manager of Office Systems Technology at Pratt & Whitney. Responsible for supporting the organization's 2,000 personal computers and 10,000 mainframe-connected terminals, Henderson is in charge of implementing Pratt & Whitney's strategy of granting users greater autonomy in the management of their PC resources. Senior Editor Amid Kornel spoke with him recently.

What is your mandate in terms of managing PC resources at your company?

Basically, the thrust is to move toward empowering our users to take advantage of the technology. The bottom line is an orientation toward speeding the delivery of the tools into the customer's hands and enabling him to take advantage of them without depending on MIS as he has in the past.

How have you organized end-user support, and how is this different from the way it was managed in the past?

We took the very technical hardware and software support, the [two] infocenters and a group of people who were supporting executive information systems and put them together in Office Systems Technology. We then split the OST group out of the data center and had it report directly to the vice-president of MIS [Doug Lewis].

Why was the change necessary?

The general view was that by having [the support function] so intimately tied to MIS, it was not being responsive enough to the end-user customers.

Did the growing proficiency and independence of end users play a role in driving this organizational change?

I would say partially but not totally. I think the drive is coming primarily from the vice-president of MIS, as opposed to being user-driven. Clearly, we have users out there who are much more aware of the technology and what it can do for them than there were five years ago. But I really think MIS has taken the initiative here. There's no question that it was in response to a lot of concern on the part of our customers that we were not being responsive enough.

Have you also looked inside the company to find help in improving your end-user support?

Yes. As a matter of fact, we have several process-improvement teams under way right now that are made up of MIS and customer people. We're using them in a series of focus sessions where we ask for their participation. We're trying to improve our response to them in terms of the acquisition process and the installation process. We're also using it to analyze what we should do to improve our customer-systems side and to determine, document and measure our response to their expectations.

Are you doing anything to harness the knowledge of your most proficient users?

We're working towards the implementation of a network of departmental consultants in which we will create partnerships with certain selected

PRATT & WHITNEY

Henderson

FROM PREVIOUS PAGE

people in the various user groups and use them as a front-line support for our customers. We're getting ready to launch that program. It soon will be in place, very likely during this calendar year.

They're already out there now. They're doing it on an ad hoc basis, and what we're hoping to do by partnering with them is able to make them part of our strategic planning.

What particular challenges, difficulties or opportunities do proficient end users create for you?

End users certainly don't represent a challenge to us. They represent an additional resource we can use. It is really in keeping with the theme of empowering our user base.

Our goal is literally to extract MIS from the process wherever possible, to stand out of the way whenever possible and allow them to acquire the tools and use the tools profitably without MIS standing over their shoulders.

Do you think information systems at your organization is well tuned to the business needs of end users?

I think we are. There is a lot of work going on from an overall information systems perspective to align ourselves more with business issues. I wouldn't say that it's outstanding by any means. That's a classic problem with MIS today throughout industry. But I think there has been an attempt to do some tie-in.

How important is the adherence to hardware and software standards in end-user computing?

Well, I think it is a tough question, and right now we are taking a position that following standards is quite important. We are trying to have an approach to our office systems where we can eliminate the wasteful duplication of application development.

WE'RE WORKING TOWARDS implementing a network of departmental consultants where we create partnerships with certain selected people in the various user groups and use them as a front-line support for our customers.

In addition, if you look at using the mainframe as a delivery vehicle for a lot of generic office functions, then you really want to have some kind of standards. We have defined what we consider to be a strategic class of applications.

And in those areas — spreadsheets, word processors — we are establishing a standard architecture that you have to be compliant with and then core products for which we will give support.

How do you reconcile your vision of a need for standards and for control over end-user-developed systems, and the need for a companywide architecture with a mission of empowering the end users?

What we're really talking about here are tools to satisfy our business, which is to

manufacture and sell jet engines. What we do as an organization has to be focused on that.

What I'm really saying is that we're going to establish an overall architecture and standard core products, but as long as a product complies with the architecture, we have no problem with that. Where something is totally outside that, we're not saying we'll exclude it, but there has

not going to have approval.

So I don't think they're going to perceive it as control. I think they're going to perceive it as some guidelines to make sure that we, Pratt, are focused in the right direction.

Despite what you said about corporate direction, would it personally make your job easier if you had greater control over PCs at Pratt & Whitney?

No. The thing that would make my job easier would be to know what is out there, not to have control of what is out there. Whether or not there was MIS control over the past five years, there were a lot of PCs brought in without the knowledge of MIS.

We're hearing from people whose hardware configuration and software constraints we do not really understand. We have a lot of people who order software that will not run on their systems, and we are not aware of the lack of compatibility ahead of time. We are creating a database now, and we have it basically completed. It gives us a way to communicate with our users.

to be a good reason.

I don't think there is a conflict if your main focus is conducting your business. The problem in the past has been not so much the standards but the MIS mentality that says we have to control everything. We really don't have that philosophy here.

Do you think users will perceive your actions as an effort by IS to gain greater control over PC resources at Pratt & Whitney?

No. As a matter of fact, we are making decisions right now that the capital funding for this kind of equipment will be pushed back into the customer budgets. Budget responsibility and the ordering process is going to be changed dramatically. MIS is not going to be in the process. We may have to coordinate, but we

If we looked at Pratt & Whitney over time, would we see that end users are in fact gaining greater freedom?

I'm not sure their perception today would be that, but I can guarantee their perception by the end of this year and by early next year will be.

Many of our end users have already been influenced by the things we're doing; others will be shortly as we break down the barriers. *

KEDIT 4.0

XEDIT COMPATIBLE PC EDITOR

KEDIT™ is a text editor for DOS and OS/2 that supports most commands and features of XEDIT, a standard VMS/XENIX editor. KEDIT goes beyond XEDIT compatibility with special PC-based features for a rapid recombination of mainframe power and PC flexibility.

- More than 100 KEDIT commands and SET options, including the ALL command.
- XEDIT prefix commands, targets, and fullscreen layout.
- Multiple files, multiple windows.
- Built-in subset of the REXX macro language included.
- Interfaces to Personal REXX, our complete implementation of REXX.
- Enhanced block operations.
- And much, much more.

"While KEDIT remains true to its heritage in retaining compatibility with XEDIT, it is also one of the most feature-packed PC text editors around." — PC Magazine, 10/31/86

will now change. Up until the last year, we haven't really had the information systems community try to find out what we do. We've never had the discourse to convey that.

Is that what caused you to become such a proficient end user yourself?

Oh yes, definitely. Once again, we had jobs to perform, jobs that I thought were important for me to accomplish and important for our group to accomplish. I found that I had to rely on myself technically. I got the package, and I had to learn it. You always need to get some help in an area, and I'm not always sure that I can count on that from information systems. Maybe not.

Are you obliged to adhere to companywide PC standards in terms of equipment or software?

My group is just putting together an order for a combination of software and hardware, and I'm interfacing with the Office Systems Technology [end-user support] group to coordinate purchasing those products.

Several of the items are what our company would call nonstandard. The response we have had so far is, "We understand your needs, and fine, we will order it for you." So I'm seeing progress in that area. I can get what I need as long as it's not crazy. At least I have the forum to discuss what we need and get some reasonable responses.

Do you feel you need even greater freedom and independence than you have now?

I would say that right now I am happy.

Would you expect more constraints from IS?

I wouldn't like to. I think that a reasonable amount of flexibility is needed to be able to do my job in an optimal way. I would like to see that ability to make reasonable choices continue.

Has being the departmental PC helped your career?

My role in producing information in a better way has definitely been appreciated by my supervisors, unlike some cases where the local guru — I'm just talking generally, not in my company — gets hurt.

Have you spoken to people to whom that's happened?

Yes. I think that's probably more prevalent than not. A lot of guru tend to get hurt because it's not consistent with their specific job responsibility.

Do you think some members of the IS staff feel threatened by the IS staff?

My feeling is that IS respects me for the things I do — maybe under the assumption that I know my stuff. I need support from both my management and information systems because, in a way, my job cuts across both. I'm a planner who has to do a reasonable amount of work on information. I'm going to be optimistic that we're moving down a good road. It's going to be a bit bumpy, but I think I've seen a change in philosophy and direction. *

DAVID X. SELDOR

Taming end-users' technology appetite

BY ALAN J. RYAN

It starts out quietly, like a client at an ice cream shop that has only one or two voices behind it. However, when end users start to get hungry for new technology and more power, the client can become an all-devouring thunder directed at the information systems department. "We want the latest. We want the greatest. We want it all. And we want it now."

This need creates a difficult challenge for IS management as companies prepare to plunge into the 1990s. New technology will possibly mean more headaches for IS managers who are mandated to maintain tight control over their company's information.

For those who say their mission is not that rigid, new technology will likely make them the heretics of their companies.

Managing the fact that some of the things today's more sophisticated users are interested in include graphics, Unix, network-

Satisfying those who want it all presents a challenge to IS

ing, computer-aided software engineering tools, multimedia, applications development, compact disc/read-only memory, laser printers vs. other types of printers, larger and larger hard disks, high-speed networks, write once, read many technology and scanners.

More power to you
Many technologies, such as powerful workstations and increased-capacity personal computers, will give users more power on their desktops. But some of the technologies evolving today will also bring more power and responsibility back to the halls of IS.

At the Providence Journal Co. in Providence, R.I., systems analyst Peter Scheidler says that one of the technologies he is most interested in is high-speed, 100Mb bit/sec. Fiber Distributed

Data interface networks.

However, because such a network will eliminate the requirement of individual disks, "all of the information will end up in our lap, and we will be responsible for it. In the past, all of the users were responsible for that information. That is going to make my life tough," Scheidler says.

New technology is changing the way information systems works, says Thomas O'Leary Jr., director of MIS technology at North American Philips Corp. in New York.

When the new technology has the potential to transform a business function and to change the manner in which the company does business and the way workers do their job, the implications are great.

"It brings up issues of possible new business offerings as a result of the technology; it

brings up issues that are really fundamental to the business and issues that cross departmental lines," O'Leary says. "So, you really need a multidisciplined team to implement that kind of change—it is not just the IS people."

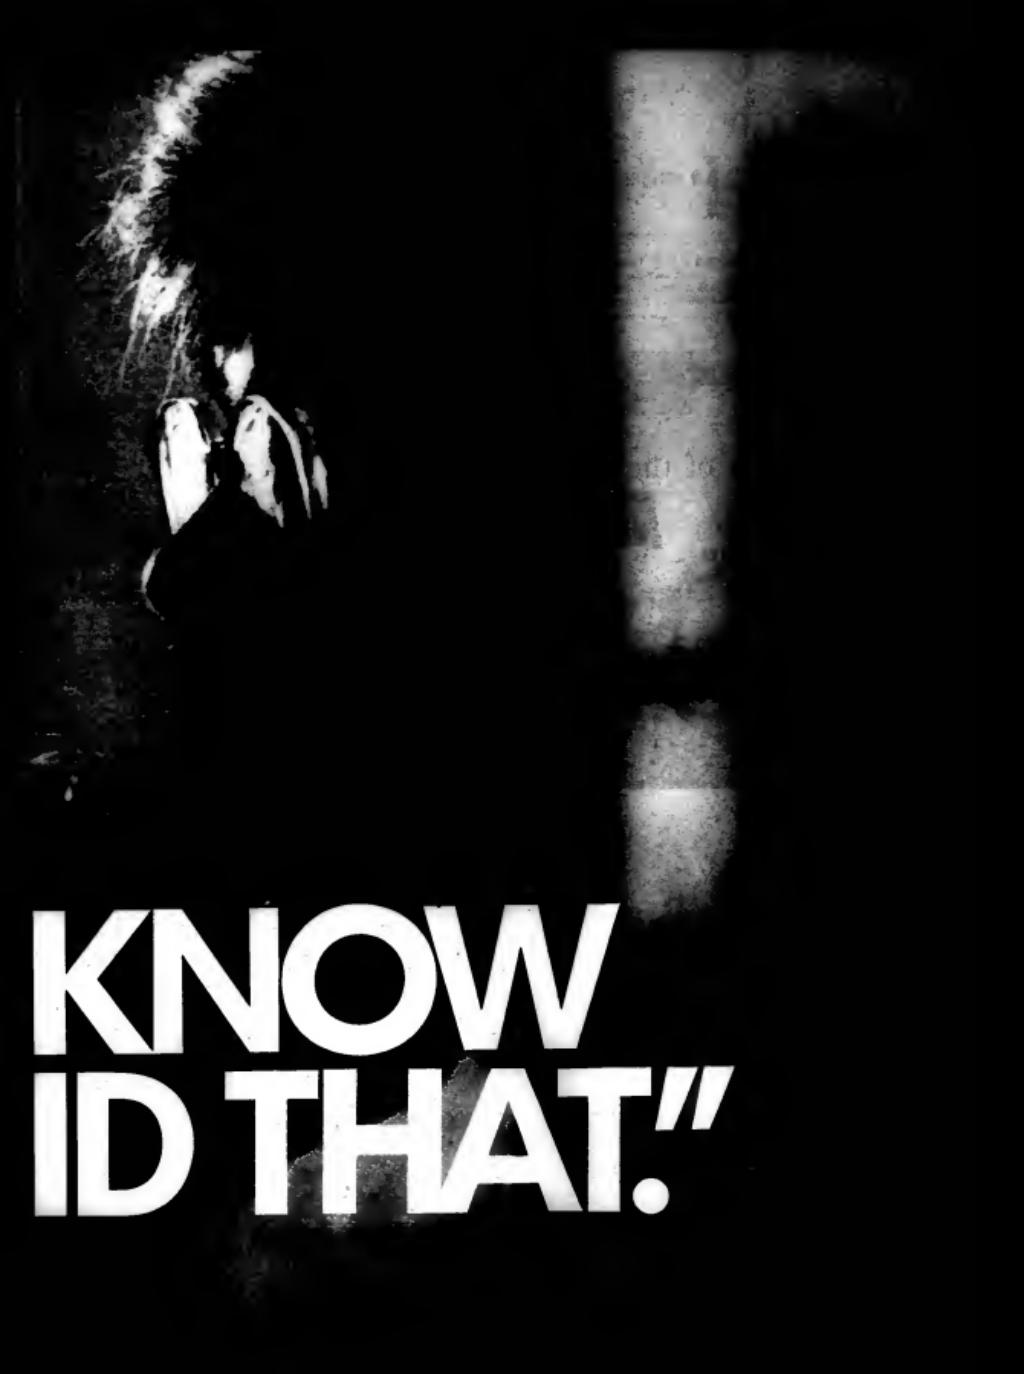

Peter Duray, the corporate technical support manager at Polaroid Corp.'s Waltham, Mass., office, says users are allowed to select many of the systems they purchase for their departments. While he usually tries to manage user expectations, he says that when they simply go out and buy new packages or systems, it can leave him in an awkward position.

"They want seamless inter-connectivity," Duray says. "Everything they have to do should be plug and play." If we don't get the chance to manage those expectations, "we are caught trying to catch up and do things we didn't plan for," taking time away from projects that could have companywide implications.

Avid technology users "are

"I DIDN'T
CODEX D

**KNOW
ID THAT."**

complicating my life like crazy," says trainer Mike Wright, department chairman of micro-computer management technology at the State Technical Institute in Memphis.

To avoid those widespread woes, IS must be willing to work with the users to bring about systems that will be beneficial to both sides, says Jay Scussel, vice-president of systems devel-

IT IS HARD for me to give up control, but I'm trying."

MICHAEL ACKERMAN
SAN FRANCISCO CHAMBER OF COMMERCE

opment at K Mart Corp. When part of the company needed a payroll system, he said at a recent conference, the systems de-

partment looked carefully and selected a package. It was never installed.

"The users didn't want it. It

was our solution, and while the users wanted the problem solved, our package was not the one they wanted," Scussel says.

Additionally, IS managers have to be more willing to part with some of the control they might currently have over their systems. Michael Ackerman, manager of support services at the San Francisco Chamber of Commerce, says, "It is hard for me to give up control, but I'm trying."

IS is not alone in needing a new outlook. Users must also be willing to take some direction and some practical instruction from IS. "There are areas of the company that are more technically infatuated," Duray says, "but with tight budgets and with a smaller work force at Polaroid, we tend to have the leverage to say we just can't do that unless you have a really good business justification for it."

Loosening the reins

For the 1990s, good information systems groups will not strive to have total control. "We are here as a management committee," not as dictators, one IS director says. If a user needs a piece of hardware or software that is not supported or recommended, it can still find its way into our organization, he adds.

IT IS NOT always practical to expect the IS director to be an expert in all areas.

PETER DURAY
POLAROID

"There are always esoteric applications and needs that we can assist with but may not be able to take the lead on," he adds.

According to microcomputer managers, educators and information systems directors at both small and large organizations, it is beneficial to everyone to let users have at least some modicum of the power they desire while staying within the company's set boundaries of standard products.

"When a user starts talking to you, he probably knows a heck of a lot more about that particular subject than the IS professional does, and the IS professional can't be the font of all knowledge on everything," O'Leary says.

It is not always practical to expect the IS director to be an expert in all areas, Duray agrees. "If I want to see my family or get any sleep," he says, "it is simply impossible to be an expert on everything."

When it comes to a clash between IS and users, "you really try to put it on a business basis," O'Leary adds.

"And, in the final analysis, the executive management of that business unit needs to weigh the facts and approve the hardware or software choice," *

Reining in departmental LANs with companywide networks

As more information is used, linking LANs to corporate systems is a must

BY MICHAEL L.
SULLIVAN-TRAINOR

User demand for instant access to information is prompting information systems to link departmental local-area networks with corporate systems. In crafting these connections, IS is gaining more control over the management of LANs.

"LANs are a significant opportunity for IS to reassess its authority and establish standards," says Jack Karp, vice-president of desktop computing at the Metc Group, Inc. in Westport, Conn.

This trend bodes well for everyone. In networks that do not conform to corporate standards, users can turn over increasingly complex connectivity and application dilemmas to the technologists.

"Users are seeing information as a critical resource," says Trish Finan, an independent consultant specializing in end-user support in Drexel Hill, Pa. "They want to help them to get the information and put it in a form they can use. The LAN has allowed them to do that. But now they want to do more with the information, and they need

Sullivan-Trainor is Computerworld's senior editor of special projects.

greater technological capability. That's where IS comes back into the picture."

However, IS and LAN management of LANs face two difficult issues:

- Differences between IS and user implementations of LANs are brought to the surface by the need for corporate connectivity.
- IS support of LANs through decentralised groups can result in contention between departmental IS and the corporate staff.

Once an outgrowth of departmental PC usage, LANs now come into an organisation through both user departments and corporate IS. End users acquire LANs to serve local needs; these installations are often not overtly supported by IS. Meanwhile, IS usually purchases LANs as a link to primary corporate systems as part of an overall strategy.

Both routes often coexist in one operating environment. For example, at the Federal Reserve Bank of Oklahoma City, Dan Straughan, operations supervisor, is implementing a LAN despite user resistance. His counterparts at the Federal Reserve Bank of Kansas City are also installing LANs but only after losing a battle with users to prevent their adoption.

"This decision is almost strictly IS-driven," Straughan says. "We have several manual processes, and if we automate them, we will do them faster."

Straughan anticipates that installing a LAN will save the bank \$30,000 in the first year of operation. Initially, he is starting with a single server and four workstations, which will eventually grow into a bankwide network.

Even though the Kansas City Federal Reserve Board, the region's head office, dictates LAN policy — specifying that banks use the IBM Token-Ring with Novell, Inc. software, for instance — the IS group is less excited about LANs. They are installing a bankwide LAN that will eventually support 60 to 70 users.

"LAN installation is more often user-driven, and it should be," says Keith Logan, who is in charge of the LAN project at the Kansas City Fed. "The applications need to be there. You don't want to spend money on a LAN and not have a use for it."

In another case, users at Pioneer Hi-Bred International Inc., in Johnston, Iowa, are clamoring for connectivity for their personal computers. But the IS group, Pioneer Data Systems, is moving slowly because of technical and economic constraints. Pioneer's system relies on Digital Equipment Corp. VAXes and Ethernet, a centrally managed environment that is expensive to forge outside links with. The company's systems structure will have to change significantly to allow

SPECIAL REPORT

Battle of the desktop: It's almost over

We went to the trenches to get a firsthand account of the battle for control of the desktop. To our surprise, we found out that for end users are concerned, the war is already over. And there's no doubt about where they stand: the user. They have finally shed the considerable freedom they continue to enjoy in managing their personal computer resources and expressed sympathy for the budgetary constraints under which information systems must labor. Most of those contacted seemed content with the current state of affairs and ready to call it quits.

However, with some prodding from Computerworld's Jolin Hsieh, the following end users agreed to tell us what they think could be done to improve PC support in their organizations.

Our MIS department is in PC-bliss,   **Erica**. One of the last things of all is to delineate with the MIS department. They tend to talk in sources and systems levels. The change will come about when IS management stops focusing on the mainframes and starts focusing on the total solution.

Patrick Niemann, telecommunications product manager of McDonnell Douglas Field Services, Santa Ana, Calif.

The Help desk could be more helpful. Sometimes I get totally frustrated when what I'm looking for is not fix or the solution to my problem right now, and it isn't always there. **Steve Walsh**, executive secretary to the vice-president of finance of A. M. Best & Co., Franklin Park, Ill.

The MIS department needs to be able to communicate more of their knowledge to us so that we can learn to fix our children up. You can take a company and tell you how to build it a spreadsheet, but then they might not explain the most efficient or effective way to use it.

John Gossman, regional controller for the eastern division of General Dynamics Computer Systems Division, Inc.

wide use of LANs, according to Sidney Jacobson, microcomputer manager. Yet the users want to reap the cost savings that PCs and PC software can provide.

"The rumblings have become a push for networking," Jacobson says. "But we have been able to stave it off because we don't have sufficient resources. We plan to go through it methodically."

Pioneer has 90 networked PCs, more than half of which are being used by programmers working with a National Advanced Systems Corp. mainframe. More than 250 PCs are installed.

In companies where users have developed numerous LAN installations on their own, IS groups must decide how much support to provide networks that do not conform to their standards and, there-

fore, make connectivity to corporate systems more difficult.

For example, users in one large utility had installed 40 LANs — many from different vendors with different architectures. The utility's IS group felt it would be a waste of resources to support all the installed LAN types, so they chose to standardize on Token-Ring.

To encourage a transition to Token-Ring, the group offered free add-in boards for PCs, installed fiber-optic cable and essentially created a communications environment that would make users' transitions to Token-Ring as easy as possible.

Still, some of the users refused to switch over, and they are running their own LANs today — with minimal support from IS.

Besides urging users to conform to standards that will make corporate connectivity easier, IS organizations, in some cases, must also learn some lessons about the differences between LANs and large systems projects.

Faced with the need to respond to user LAN requests quickly, IS professionals sometimes overlook the requirements definition for traditional systems.

"In dealing with power users, you're working with a moving target and IS can't keep up," says Nick Wasilawski, director of systems development at the U.S. Navy Aviation Supply Office.

For example, Wasilawski's staff developed a LAN application for end users who simply wanted to rearrange spreadsheets. The application required the

Presenting InfoImage solutions. A totally new kind of imaging system: Practical.

UN

handling of large amounts of data that quickly degraded network performance. "It's not just a matter of changing the software. We have to wait for the next generation of products to meet the needs," he says.

To guarantee that IS professionals know where user requests will lead, many companies have decentralized LAN support, assigning technical professionals to user departments. But this solution creates a new set of problems.

For example, Louisiana Power and Light is struggling with linking local networks with larger corporate systems. One of the primary areas of contention is between decentralized IS groups within user departments and the corporate IS organization.

The promise of imaging technology—computer storage and management of essential documents, and elimination of your paper burden. It's a promise many computer vendors are still struggling with.

It's a promise Unisys has kept.

Presenting the Info Image suite of practical imaging solutions. Integrated, total systems designed around your business.

Solutions that work with your existing computer environment. Practical imaging solutions only a total information systems company can give you.

Take Info Image IIPS, a virtual money-making machine for banks. It digitizes checks to process them faster than any conventional

In one case, a decentralized IS group installed a Unix-based network in a key department even though corporate IS does not support the use of that network for the rest of the company.

"Companies have to decide whether to optimize the business unit or the corporation. Different corporations decide that issue in different ways," says Evelyn Arshak, a vice-president at Info Image Corp. in Cambridge, Mass.

Despite the difficulties, Arshak says, it is more effective to decentralize end-user LAN support than to run it from a central group. The main reason for this is that IS

FACED WITH THE NEED to respond to user LAN requests quickly, IS professionals sometimes overlook the requirements definition for traditional systems.

can manage technology from a distance, but the only way to manage the changes technology brings is by living in the user department. "When IS professionals are dealing with the users," Arshak says, "they have to make a shift to understand the technical problems. In the centralized structure, IS is like the high priest speaking from the mountain and no one listens."

system. The cost of operation drops dramatically while throughput increases.

There's Info Image EDMS, our Engineering Document Management System. It reduces the costs, errors and delays associated with managing and distributing engineering documentation.

More imaging solutions are on the way. They're based on modular implementations and open architectures to work with your existing environment. They all upgrade for more capacity and new technology.

If you're looking for imaging technology that's real and practical, instead of practically real, call for our free demonstration diskette.

technology can do for you.

iSYS

Other observers advocate a return to central LAN support. "What organizations need is a focused IS group to support LANs in a central fashion. It's taking time for that to happen because it requires crossing organizational domains," says Scott Stein, a senior PC analyst and director of strategies for microcomputers and office systems at Framingham, Mass.-based International Data Corp. "The organizations that are struggling are the ones that are trying to maintain the decentralized mode."

The bottom line is that while there is no simple answer to LAN management problems, the requirement to link LANs to corporate systems is inevitable as users become more sophisticated in their use of information. *

... or is it?

I would like to have more training than just what is received off-site. Once I have had the training, little questions always seem to pop up. I don't know how feasible this would be since for them to let us have about updated versions of certain products that are available. They should be feeding us this information right along. *Marcia Corp., executive secretary at Ciba-Geigy Corp., Teter River, N.J.*

I know they don't have the manpower to be with everyone, but I learn best with hands-on experience. I would like detailed classes involving projects that are job-related. If someone is sitting next to me while working on a specific project, I seem to get more out of it at first, rather than trying to apply what I have learned in the classroom to my job by myself. *Tamara L. Johnson, manager of systems implementation, client in academic administration, at State University of New York at Stony Brook, N.Y.*

The one thing that I find is that the documentation could sometimes be a lot better. *Vicki Miller, manager of corporate budgeting at Imperial Sand Co., Woodbury Lake, N.J.*

It's costing that's the problem. If you want another level of service, you would need to have a company to go with it. We had the resources to get more support from IBM in terms of PC software evaluation, software support and so forth. *Dee S. Phillips, manager of corporate financial systems at Mind Corp., Dayton, Ohio.*

Are You A Proving Ground For Your International Long Distance Company?

Why should your network be somebody else's learning experience?

At AT&T, we've been managing the largest international telecommunications network for more than 60 years. We have more direct links from the U.S. to overseas locations than anyone else, period.

So when we take on your company's private network we have the capabilities, knowledge and know-how to do the job right.

We work with you to recommend the system or service to meet your needs and whether it's managing a mission or designing a global digital network, the AT&T Worldwide Intelligent Network ensures that your application will run smoothly.

So call the AT&T International Response Center at 1 800 448-8600.

And work with a company that already has a wealth of experience, instead of one in search of it.

AT&T

The right choice.

All in this together

DANIEL K. BREWER

IS climbs down from its perch to erase the 'us-them' barriers

BY NAOMI KARTEN

There's a change in the wind. Information systems professionals are coming out of their ivory towers and getting to know other organizations. As a result, the IS/user relationship is changing from "us-them" to "all of us working together," and that negative word "adversarial," long used to describe the relationship between IS and end users, is becoming outdated.

In record numbers, members of information systems departments are visiting user departments, where they are learning about departmental activities, observing work-in-progress and even participating in specific projects.

IS professionals, many of whom have rarely ventured into the user community, are often

amazed at what they learn about the businesses they are in. Contrary to the expectations of some IS staffers, most user departments are eager and willing to take the time to talk about their environments, responsibilities and concerns.

These "field trips" are not just an afterthought, however, or something to be done only after all other work is completed. At Bethlehem Steel in Bethlehem, Pa., for example, the IS organization has established a target of 20 hours per IS person, on average, to be spent in user areas. The objective, according to IS Program Manager Phil Carpenter, is to pull IS people out of the floor to learn more about user functions.

Thus, some IS employees have spent several days in home-office departments, such as transportation and purchasing, where they've observed departmental activities and even gotten some hands-on experience.

In the transportation area, for example, IS employees have been shown the complex process by which freight rates are calcu-

lated. Other IS employees have taken trips to the plant for an up-close look at steel-making technology and the steel-making process. Getting a firsthand look at blast furnaces in action is a unique experience for most IS visitors.

At Riverdale Methodist Hospital in Columbus, Ohio, as at many other hospitals, information center staff members have tended to know a lot about computers but little about the hospital environment. To address this situation, Dorothy Myers, information center assistant director, instituted an informal program in which information center members visit a different department each month.

Although the emergency room is off-limits, the group of 10 has visited the magnetic resonance imaging department, the laboratory and the morgue. Visits are limited to 1½ hours, with the first half-hour devoted to discussion and the remainder to walking through and observing how the area functions.

Myers found that the departments she contacted were very

open to these visits. A key reason is the brevity of the meetings, which means that hospital staff members do not have to spend a lot of time in preparation. The hospital staff benefits also.

"We ask them what we can do to help them on their job," according to Myers. "That's their ticket."

How well are these programs working? "We haven't even begun to tap the potential yet," Carpenter says. The immediate benefits, he finds, have been in terms of improved communications. Over the long term, it is expected that the new and broader perspective of the organization will make a significant difference in the support IS delivers to its customers.

Myers is similarly enthusiastic. "We are getting to know our customers better," she reports. "We're better able to see them as individuals who need to get a job done. This helps our customers, not just distant figures." In addition, the information center staff has received excellent suggestions during their meetings

like to be. Small, powerful and affordable.

© 1989 Toshiba America Computer Systems Division

At Toshiba, we've discovered that one way to enlarge upon an idea is to make it smaller.

That's just what we've done with our new PageLaser6.

For one thing, we made it 30% smaller than the leading 8 page-per-minute laser printer.

And then we gave it a price

tag that's at least 25% smaller.

We even brought compatibility problems down to size by making the PageLaser6 totally compatible with the HP LaserJet system. In fact, you can even use your existing HP font cartridges.

The new PageLaser6 is a perfect complement to your desk-

top computer or any of our full line of truly portable PCs. And it gives you the kind of high-quality images you'd expect from the leading laser printer.

It's just that ours does it in a lot less space. For a lot less money.

And that, we feel, is no small accomplishment.

In Touch with Tomorrow
TOSHIBA

Toshiba America Information Systems Inc., Computer Systems Division

with hospital staff — "much better than surveys," according to Myers. And these suggestions in turn enable the information center to more effectively deliver the services that customers need.

Site visits are not the only path to partnership. At The Toro Co. in Minneapolis, TUG — or Toro Users Group — is evidence of partnership in action.

Although TUG was established by the end-user computing services group, it is now run by the users. The TUG president is a business user who serves for a period of two years.

In addition, each of the three subgroups — for the mainframe, Wang and PC platforms at Toro — is run by an elected coordinator who is also a user.

Monthly meetings are plan-

ned and conducted by users, but each of the coordinators has a partner — a member of the end-user computing services staff — who can be called on for guidance and assistance. For the most part, however, members of the support staff participate in TUG meetings as attendees, not as planners, leaders or directors.

Furthermore, according to Barb Scammon, a member of

the end-user computing services group and a prime mover behind TUG, the support services group accepts tasks from users at these meetings. It is the users who drive the process.

Possible Impact

Scammon, a PC specialist, and her colleagues — Beth Runkel, a specialist in Focus, Information Builders, Inc.'s fourth-genera-

tion language, and Stephan Lind, a Wang specialist — have found that TUG contributes to a positive working relationship with users.

One of the keys to TUG's success, they believe, is the support it receives from upper management. Not only is that support loud and clear, but top-level managers also participate in the group by giving talks at TUG meetings and by recognizing employees who have developed applications that achieve a business objective.

THE organizations that have been most successful are the ones in which senior management clearly communicates that a partnership approach is the way business will be conducted.

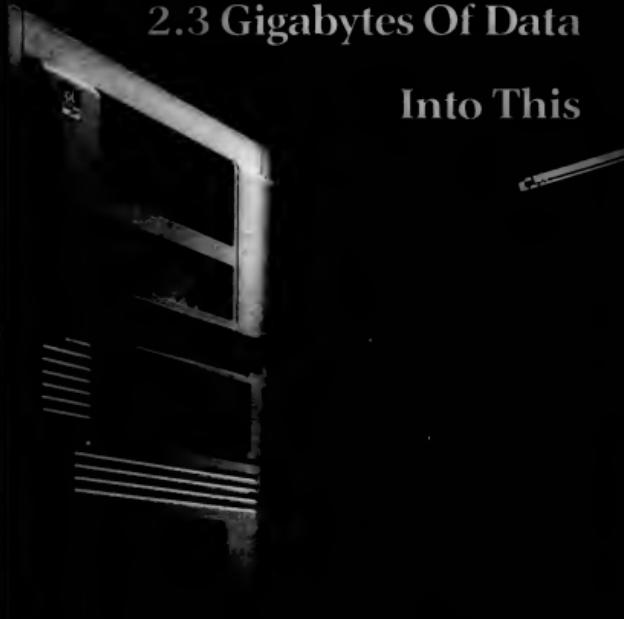

Finally, it appears that even the delivery of traditional computing services can be effective components of business partnerships. An example is Philadelphia-based Consolidated Rail Corp. Conrail recently implemented an employee PC purchase program that not only makes PCs available to employees nationwide at discounted prices but also offers an interest-free loan to facilitate the purchase. According to Frank Gallagher, Conrail's assistant director of office support, employee interest in the program is phenomenal.

Top management key
As effective as all these activities are, most IS managers agree that the top management contribution to success in relationship building is the attitude and support of top management. The organizations that have been most successful are the ones in which senior management clearly communicates that a partnership approach is the way business will be conducted.

As Myers pointed out, she doesn't need senior-management permission to visit customer departments. However, her efforts have been visibly supported by her own management, and the organization as a whole has clearly set the tone that it wants to build partnerships.

If these activities are any indication, the 1990s will indeed be the decade of partnership. As IS managers take steps to strengthen relationships, they are becoming better informed about the business they are in. And the more they learn about their business, the better their relationship with their users becomes. In the process, everyone wins. *

The IPL 6800 Series Turns 2.3 Gigabytes Of Data Into This

ipl

Turning to the outside for PC support

BY DAVID A. LUDLUM

You can't really call it a trend, but more information systems organizations seem to be turning to outside companies to provide personal computer support services.

"We believe there is greater interest among clients in outside support," says Jeff Kaplan, director of The Ledgeway Group, a market research firm in Lexington, Mass. "However, we also believe customers are still apprehensive about the capabilities of outside firms to provide that support effectively."

Indeed, Ledgeway surveyed more than 900 large companies and other organizations earlier this year and found that 59% of them expect to increase reliance on their internal staff for PC support over the next two years.

However, interest in outsourcing keeps bubbling up. "I think there's a little trend to supplement the local staff with outside vendors. It's a choice that every information center manager needs to make," says Julian Horwitz, executive director of the Chicago Association for Microcomputer Professionals, a group of corporate PC managers.

Interest in outsourcing PC support is evident to those addressed to Epcos, Kodal, Co., after its recent move to outsource support for 25,000 PCs across the country to Businessmail, Inc. "We've had a lot of inquiries. A lot of people have asked us about what we're doing and why we're doing it," says Joseph Lupino, who orchestrated the move as director of partnership relations at Kodak's Personal Computing Services unit.

The fundamental variable in decisions about outsourcing PC support is the number of computers involved. Managers with relatively small flocks of machines to shepherd have traditionally found it less expensive to turn to outside service providers than to maintain an in-house support staff.

A chief reason is the reliability of personal computers. "If you staffed up to do your own hardware maintenance, your people would

DAVID K. JOHNSON

Cost is a big consideration, but user needs and corporate strategy come first

be sitting around like the Maytag repairman waiting for something to break," says Robert Knapp, general manager of Blue Cross Shared Services Center in Lemoyne, Pa., which operates about 50 PCs.

Scales of business

On the other hand, Hughes Aircraft Co.'s Ground Systems Group in Fullerton, Calif., finds it cost-effective to handle most hardware support for its 6,000 PCs in-house. The group does turn to outside providers for problems with modified equipment used in small quantities. "It wouldn't be cost-effective to maintain inventory for a small number of items," says Merlin Buckner, the Ground Systems Group's supervisor of PC and terminal maintenance.

A shortage of staff members could all but

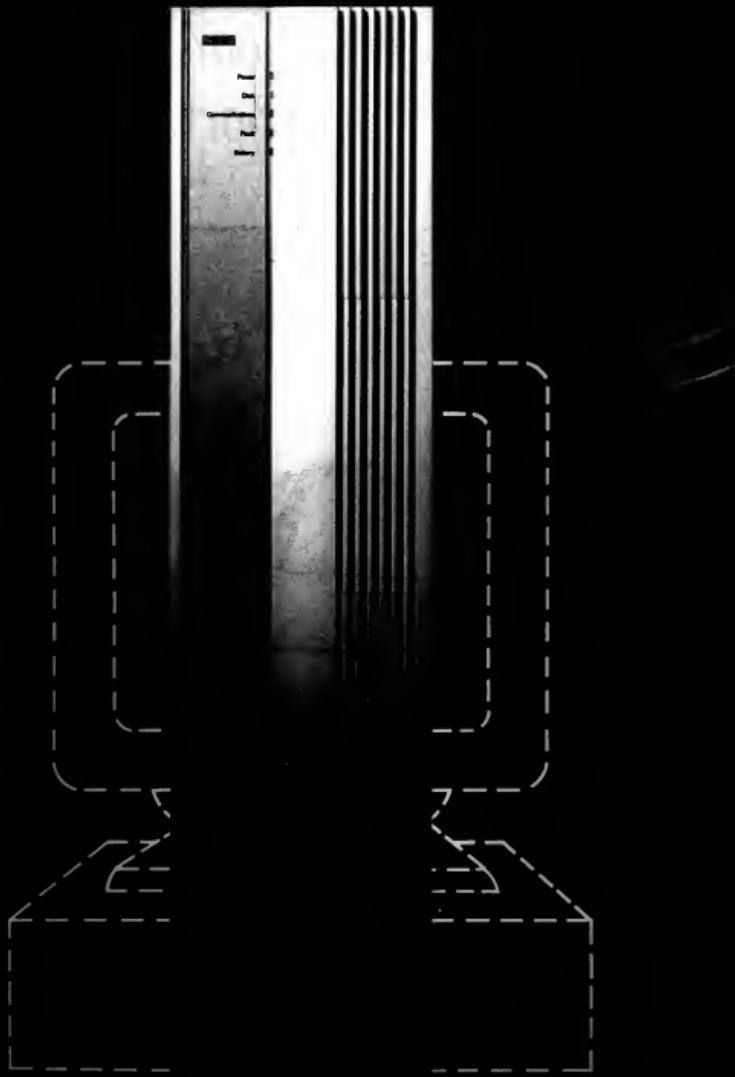

force an IS organization to outsource PC support, particularly with growth in the use of PCs frequently outstripping growth in the staff to support them. "Many information centers find it difficult to staff up to keep in sync with demand," Horwitz says. "One way to leverage yourself is to use outside vendor resources."

Hughes' Ground Systems Group complements its extensive in-house support with outside providers when facing a backlog of service requests.

In-house support organizations do not become understaffed just from lack of resources or rapid growth in the use of PCs; sometimes they cannot find the people with the skills needed to support new or complex technologies, so they outsource support in those areas. "Some companies might farm out something like LANs," Horwitz says. "They pick things they can do the best and farm out the rest."

Companies with multivendor installations can find it too difficult to recruit people with the breadth of knowledge needed to support the installations and too expensive to maintain a staff that encompasses the expertise. "We've decided to outsource a lot last year to outsource hardware support for 1,900 PCs at the New York headquarters of Pfizer, Inc., a pharmaceutical company. "The third party has the experience with all

LED THE CONCEPT LAN SERVER.

The NCR Tower is a LAN server that overcomes the limitations of limited PC power at a comparable price. Unlike AppleTalk™ and Novell® have to pay the cost of NetWare for the same power, the Tower gives the family of servers the power of NetWare without the cost.

With its multiple applications and multiple users, the Tower replace multiple PCs and workstations on a high-order host system. It can run system application, communications, and file server. DOS-based or OS/2-based, it can perform only one task at a time. The modular architecture of the Tower allows you to easily migrate to LAN management. You can add modules as your needs grow. You can even swap them up based on the needs of the server.

The Tower's LAN networking lets you share information management, communications, and other system resources that are not available on individual PCs.

The NCR Tower comes with all the power and support that has made our award-winning line of multuser systems the best in the country. And with our long commitment to systems integration, we can help you make the most of the Tower.

This is the
biggest
computer
announcement
Digital
has ever made.

Introd
the VAX 9000
The biggest news
for your

ucing
mainframe.
is what it can do
business.

Introducing the VAX 9000 series. It's a mainframe. And best of all, it's a VAX computer.

It's a mainframe.

Just for starters, the VAX 9000 series is what is traditionally known as a mainframe. It has the high performance you expect in a mainframe. Over 100 times the performance of a VAX 11/780 system.

It has the high capacity and balanced I/O you want. Up to 320 MB/sec of sustained throughput.

And the ultra-high reliability, uptime and availability that mission-critical applications demand.

Yet, while the VAX 9000 is certainly a mainframe, it is by no means a traditional mainframe. Because extraordinary cost, complexity and inflexibility are not part of Digital's computing style.

Our style is the VAX style. Known as the most easy-to-grow, easy-to-use and easily networked architecture in computing. An architecture with 6,500 applications already existing today. And the architecture with the lowest cost of ownership. Which makes the new VAX 9000 mainframe a better choice for such high-volume production applications as global securities trading, accounting, administration, billing, intelligent network management, funds transfer, manufacturing resource planning, and claims processing. And a whole list of other large database-intensive applications. All of which should make it quite clear there's nothing a VAX 9000 mainframe can't do.

It's a supercomputer.

The VAX 9000 mainframe is also Digital's entry into supercomputing.

Each VAX 9000 CPU can be optimized with vector processing that gives it up to 500 MFlops of number crunching performance. Vector processing makes the VAX 9000 series ideal for such incredibly number-intensive tasks as predicting the course of the economy, or the course of an atomic particle.

In fact, there are thousands of new packages for such scientific applications as seismic processing, physics, chemistry, engineering and finite element analysis ready to be vectorized.

And our VAX FORTRAN compiler will automatically identify and vectorize computations in your applications. Which means work goes faster than you can say "vectorize".

Our compiler can also automatically divide the work across several processors in a VAX 9000 system, making your applications run even faster.

And best of all, it's a VAX.

The VAX 9000 series is the result of new technology that gives it five times the speed of the fastest previous VAX system. But it's still a VAX. With all the advantages of the tried, true and proven VAX style of computing.

The VAX style is a style that will grow with you. Whether you start with our smallest MicroVAX® system, our VAX 6000 mid-range system, or our largest VAX 9000 mainframe, you can grow your system without having to rewrite software. Which gives you the widest range of fully compatible systems in the industry.

Which is very important when you consider this: rewriting software is the highest cost of owning a computer system.

© Digital Equipment Corporation, 1989. VAX, VAXcluster, MicroVAX, the D

Image and Digital has a new look trademark of Digital Equipment Corporation

The VAX style accommodates other vendors' styles of computing, too. Our Network Applications Support (NAS) makes it so easy to do multi-vendor networking, you can turn a whole company full of incompatible computers into one big network of suddenly compatible computers.

And the VAX 9000 series takes advantage of another unique feature of VAX computing: the VAXcluster™ System. Simply put, a VAXcluster System makes all individual VAX computers all work in concert, sharing data, applications and peripherals. Which is not only an easy way to increase your systems power. It's also an easy way to make sure no single point of failure can bring your system down. Perfect when the mission's critical.

And now, VAXcluster technology has been enhanced to provide balanced I/O performance for high-capacity systems like the VAX 9000 mainframe. And you can scale I/O capacity incrementally as the workload grows.

It's reliable.

As surely as the VAX 9000 mainframe will set new criteria for

performance, it will set new criteria for reliability.

The VAX 9000 series detects and fixes problems at the most opportune moment. Before they happen. Because intelligent self-diagnostics and intelligent maintenance are built in.

Critical control components components are redundant redundant. Ensuring maximum uptime. And even during routine maintenance. Digital's unique power partitioning allows programs to continue without interruption.

And there's even a power-protection system built in. So blackouts and brownouts won't put you out of business.

The support behind it.

What's so powerful about the VAX 9000 series isn't just what's inside it. It's what's behind it.

Things like the comprehensive support of Digital sales and service all around the globe.

The support of a whole new line of high-performance peripherals. Such as optical libraries. Solid-state disks for I/O bound applications. The latest in system performance monitors, disk striping and high-performance

cartridge tape backup.

There's Enterprise Services for full consulting support on how to make your computers work the best way of all: the way your business works.

And finally, there's one last word of support. The Digital name. A name whose reputation has made us the second largest maker of computers on earth.

Run with it.

There are already 6,500 applications waiting to run on the VAX 9000 series. So find out how you can run with it today. Just call your local Digital sales office. Or write Digital Equipment Corporation, 200 Baker Avenue, Concord, MA 01742-2190.

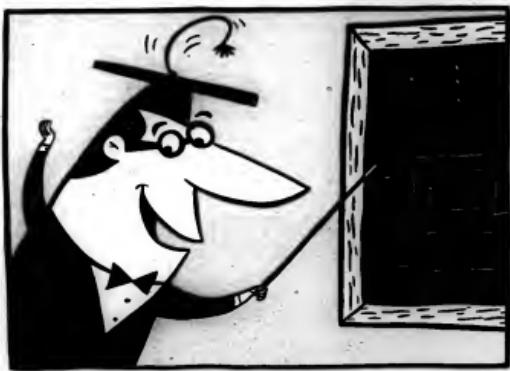

You'll find the VAX 9000 mainframe may not only be the highest coming announcement in

Digital's history. But in yours.

IS faces the challenge of providing users with more effective training methods

End users tell IS: ‘Stand by me’

BY ALAN RADDING

The days when information systems could simply show PC users a few DOS commands and go over the basic key-strokes from a popular software package are over. Today, IS may find itself under pressure from both users and management to upgrade its training. Growth in the power and complexity of personal computer applications is outpacing many training programs.

"End-user computing is an area we have struggled with," acknowledges Elizabeth Regan, an in-house consultant for the user interface and trainer at Massachusetts Mutual Life Insurance Co. in Springfield, Mass. "Maybe 10% of the user population can take technical classroom training and run with it," Regan estimates.

The bottom line for PC training is user productivity.

Radding is a Newton, Mass.-based writer specializing in business and technology.

cent survey, Arthur D. Little, Inc. in Los Angeles found that out of 12 hours dedicated to systems use, users spent four hours just trying to learn how the system works. "For every 10 hours that users spent at their PCs, they spent about two hours blundering around trying to figure things out," reports Gilbert Horne, a senior consultant at Arthur D. Little. "Then, they also spent another two hours away in classes, reading manuals or giving help to others."

The demand for IS is both a challenge and an opportunity. The challenge is that IS is being asked to provide more and different training that focuses on the application of PCs to business problems and instills good information-management practices among PC users. The opportunity for IS is to use training to regain influence and support among the PC community and to help shape the direction of end-user computing.

Joseph Caruso, director of American Express Co.'s corporate systems and technology in New York, estimates that by early 1990, the IS department

will have put 12,000 personnel through at least one of the approximately 40 course offerings that make up the company's PC training program. As Caruso sees it, that is about 12,000 people spread throughout the organization.

However, experts warn that IS should not try to use training and support to control end-user computing the way it controls larger systems. "The goal shouldn't be to control end-user computing, but to make it more efficient and more productive," says Bridget O'Connor, assistant professor of business education at New York University.

Don't rush them
IS must be patient while users discover for themselves the value of professional support. "At the beginning, users went off and didn't want our help," says Clarence Hoover, director of information services at First American National Bank in Nashville. After a while, they discovered that PCs were not as simple or easy to use as they thought. "Once they realized how much trouble you can get into, they

came looking for help. They don't want to be computer experts. They just want to do their job," Hoover continues. When IS welcomed them back with abundant support and training, they willingly came along even though it meant accepting IS rules.

Steve Stanton, IS consultant at Index Group, Inc. in Cambridge, Mass., agrees. "The best way to reinforce a lesson in backing up data is to let a user lose data," Stanton says.

Americane Express' IS department uses an extensive training and support program on popular PC software packages to build support for IS throughout the organization. In the process, IS has become more sensitive to its users, Caruso reports.

The training is not mandatory, so IS must market its training internally to users. "It's very competitive. We are constantly updating our curriculum," Caruso says. Because IS must sell users on its training (charging them about \$200 for the initial half-day PC course), the department is highly motivated to stay abreast of its customers'

needs and is sensitive to customer service and satisfaction. The payoff, Caruso discovered, is that satisfied customers not only buy more products, but also become friends of, and advocates for, IS. "We're the first point of contact most people have with IS, so we try to make it positive," Caruso says.

Boost of burden

The burden of making the experience positive falls heavily on the training instructors, who not only teach the classes but are also available for individual coaching and support. "The instructors are often a person's only contact with IS," Caruso notes.

Security is another critical training issue. "We have a lot of people getting in-

NOW THAT PC USERS are downloading data from information systems mainframes and handling mission-critical applications, IS departments are scurrying to remedy the lack of training in PC systems management.

nious with applications, and there are a lot of databases out there. There's a security issue," Hoover says.

Now that PC users are downloading data from mainframes and handling mission-critical applications, information systems departments are scurrying to remedy the lack of training in PC systems management.

"We try to instill good IS values in some of the basic courses, but we haven't been driving the message home," Caruso says.

Specifically, American Express' programs touch on the importance of backing up data while giving some attention to virus protection. Users are expected to be responsible for what happens after that.

"We hope the business units will take it up," Caruso adds.

Buy non-IS managers who are not systems-savvy themselves can hardly be expected to keep after their own users about good systems practices.

"System security and protection are areas where managers need more help," Regan says.

But it is not necessarily the job for IS. At Massachusetts Mutual, the effort to install and enforce good IS practices has been taken out of IS and given to the internal audit staff.

IS must recognize the difference between computing activities that affect the organization in critical ways and those that fall purely into the realm of personal productivity.

End-user computing is "at times inefficient, but that's how the world gets work done," Hoover says. Someone might lose a disk full of data, he says, but in the past, people lost funds by tampering with the data. Except in cases in which the PC users do mission-critical transaction processing, IS has to allow them to fumble, he adds.

However, where the end user's actions affect the integrity of the organization's information systems, IS must take action.

At First American National Bank in Nashville, the bank's IS executives realized that end-user computing could quickly get out of control when PC users started requesting access to data in the department's mainframe systems. The department decided to take an active stance, using training and support as leverage to exercise some measure of control, says Willis Rhodes, executive vice-president of the bank's operations and information services.

Feeling motivation

The bank was further motivated by the U.S. government's controller of the currency. Federal regulations require that banks establish adequate controls and procedures for the security of data systems, including end-user systems.

"We had to make sure they are in sync with our overall program. We had to make sure they weren't outside of control," Rhodes says.

To do that, IS established a PC group that operated a purchasing center and a training and support center.

Initially, users resented the control the bank's IS was trying to impose on them, but through generous training, the department won the users over.

"We give them a little bit of the whole iso-creed, you know, right? We install the machines, train them and support them. They see that there is more benefit to it for them in our way," Rhodes explains.

To bring the users further into the IS camp, the department just published a new policy and procedure manual for PC use, adds Hoover, the bank's IS director. The policy establishes controls regarding documentation, backup and security. "In principle, it is no different from our mainframe policy, except it is not as stringent," Hoover says.

The exceptions are cases where end users are accessing mainframe data, in which case all the mainframe controls apply.

Rather than playing the role of cop, IS lets down the law and tells users in what they have to do. The internal auditing department is responsible for enforcement, Hoover adds, so that IS does not jeopardize its support relationship with users. *

Stalking the copycat and other wild creatures

BY MICHAEL COHN

There once were only two kinds of people in the world: people who worked with computers, and people who hated people who worked with computers. Everyone seemed happy, people kept pretty much to themselves, and we computer folk did not have to continually explain all our acro-

Evolution was slow, especially when everybody was busy standing in line for a card-punch machine. However, with the advent of the computer terminal, the nontechies really messed things up. They wanted terminals on their desks. They wanted documentation. They even wanted reports.

With personal computers everywhere, it is now completely out of hand. You cannot even tell the computer guys from the non-computer guys anymore. "Everyone thinks they're an 'end user,'" Some end users think

they can analyze our data. Some end users think they can download our data. Some end users think they just lost our data. All of them phone at 5:00 on Friday afternoons.

This is a field guide. You cannot avoid end users; they're even allowed on domestic flights of less than two hours. But learn to recognize the most common end users from a distance. With a little luck, maybe they will go away.

Mr. PC
Mr. PC thinks mainframes are worthless. Everything you can do, he can do better on a PC. He knows all sorts of acronyms and languages that you've never heard of. He could recode the entire pay roll system in three hours using NCAA. He could rewrite General Ledger using Alberto/VOS.

Keep Mr. PC happy. Every other week, cut him a detected continent or old school file and some bowling scores. Never, never let Mr. PC upload, or download, or network, or interface or try anything that can get him near the mainframe. Because if he does, he will either

produce some awesome four-color pie charts or suck all the power out of the building.

The Copycat

Maybe you are in charge of a very important database. Maybe it keeps track of all the tax returns in Minnesota. Maybe it lists all the numbers that stock chin in the human. Whatever the case, if it is very important, never let a copy slip into the paws of the Copycat.

The Copycat doesn't care if the data is current or 12 years old. He'll stick it on his own PC. He'll tell all his friends he has the data. If he remembers, he'll occasionally update it. He'll run his own reports. He'll write memos. He'll wallow in his parallel system and gladly leave you alone, until that fatal day when a vice-president suddenly wants to know a whole lot about your very important database.

The Copycat will then do a lot of yelling and organize a task force, and no one will know who has chili with-

out beans for several months.

The Rabbit?

The Rabbit keeps to himself and appears totally harmless. He has his own project-tracking tool. He has his own database tool. He understands end-user computing. The Rabbit is really smart.

Kill the Rabbit! Rabbits multiply, and soon there will be hundreds! They all will seem really smart, except to one another. They will fight over whose tools are better. They will waste your time asking for extracts and summary files and reports and diskettes.

Fortunately, all Rabbits want the same data. Unfortunately, no two Rabbits want it in the same format. All you can do is try to smooth the whole thing out. Call a meeting of all the Rabbits. Encourage them to work out their differences. If you can get everyone in one place at one time, you can run around and cram grape jelly in their disk drives while they're busy arguing.

Mr. Yesterday

This end user is unusually deceptive. Mr. Yesterday stops you in the hallway and asks something

IBM DATA ACCESS SOLUTIONS

Relief From The Data Detail

Data Interpretation System

The smartest way to simplify your job—by simplifying your end-users' jobs.

As you've probably noticed, data requests from managers and

analysts always seem to share the same deadline:

"Yesterday."

Which is exactly why there's the IBM Data Interpretation System: a surprisingly simple way for end users to access, manipulate, analyze, share and store information—right from their own desktops.

In other words, without causing a backlog of requests for data or customized applications at the usual place—your desktop.

This welcome self-sufficiency is made possible through the use of IBM's mouse-operated, icon-driven graphical environment.

Now, with simple points and clicks, the professionals in your company can access internal or external data bases using your existing IBM mainframes and IBM local area networks of PS/2® Models 70 or 80. And they can do it within seconds.

Without the MIS department's day-to-day help.

This new Data Interpretation System can even complement your plans to implement IBM's Systems Application Architecture™.

All of which frees you up to develop major business applications, bring new data bases online, explore new technologies to help your company explore new opportunities—and enjoy more of something maybe you haven't had in a while:

Time.

With a simple point and click, they'll be developing their own personalized applications.

The new IBM Data Interpretation System. For more details, call us at 1 800 IBM-2468, ext. 193. Or just send us the coupon below.

Please provide me with more details on exactly how the IBM Data Interpretation System can give me welcome relief.

NETWORK EFFICIENCY TEST

1. Has your minicomputer become the most expensive word processing and E-mail system on earth?
2. Do you need to manage more types of cabling than the phone company?
3. Are networking problems causing your PC LAN to work less hours than you?
4. Is your application development backlog over 6 months? Over 1 year? Over your head?
5. Are you feeling insecure about your PC LAN security?
6. Is the performance of your network going down as the number of users goes up?
7. Do your computing vendors spend more time pointing fingers at each other than pinpointing problems?
8. Is it impossible to expand your computer system the same way you add users. . . incrementally?
9. Is Engineering having trouble communicating with Marketing? Is Building 2 difficult to reach from Building 6? Is the second floor not talking to the seventh?
10. Are your users wasting time trying to communicate with uncommunicative hosts?
11. Is your computing system unable to run both DOS and OS/2 programs? How about the new SQL database applications?

SPECIAL REPORT

IS YOUR NETWORK IN NEED OF WASTE MANAGEMENT?

If you answered yes to any of these eleven questions, your computer network is wasting two things.

Time and money

Fortunately, there's one company that specializes in turning hazardous waste into manageable networks. 3Com.

3Com's 3+Open™ Client-Server System offers you the security and manageability of a minicomputer. As well as the ease of use and broad application support of a PC LAN. And about it. The best of one small investment.

This combination of our file server and 3+Open LAN operating system, power and uses. And it runs even better.

Or just say hi.

The creator of the AS/400
left a few things out.

Once again, it took IDEA to complete the picture.

Ask IBM about the connectivity capabilities of the AS/400 and they'll say they've got all the pieces put together.

Sure, they've integrated PC Support into the host system, but upon closer inspection, you'll see there are a few details that Big Blue has overlooked.

Diminished host performance.

With PC and PS/2 users connected to the AS/400 via PC Support, you may discover you'll require a larger CPU or a second one just to handle your basic computing needs.

Running PC Support on the AS/400 consumes a lot of expensive host resources - at least 300-500K of host memory per user. And that's probably enough to bog down the host and make it unable to process data at the pace your organization needs it.

PC memory loss.

By accessing the AS/400 via PC Support or a Token Ring connection, your PC doesn't have enough memory left to concurrently run the PC applications it was designed for. The combined functions of PC Support take up more than the 640K memory allotted by DOS. Which means you'll be loading and unloading PC software applications to stay within DOS.

Eventually, a PS/2 running OS/2 may solve

this memory consumption problem, but can you afford to replace all your existing workstations?

Feature limitations.

To make matters worse, PC Support restricts your terminal and printer emulation options. It doesn't offer Model 3180 emulation, so you can't work in 132 column documents. There's no Model 4214 printer emulation. And you'll find PC Support is pre-configured for IBM PC printers only. Configuring your third-party equipment will cost you time, money and aggravation.

We put it all together.

If all this leaves you puzzled about the connectivity of the AS/400, you should know there is a solution - the IDEA family of 5250 emulation boards and software.

Our local, remote and gateway connections bypass PC Support to give your PC enough memory to run PC applications while it concurrently accesses the host.

In fact, we give you more sessions while using a great deal less PC memory.

Our connections make optimum use of all your existing equipment - third-party printers and PCs and PC-compatibles running DOS or OS/2.

And we also offer an Adapter Handler if occasional access to PC Support is desired by any of the users on your system.

For the complete picture, call IDEA at 1-800-257-5027. We'll show you how to put all the pieces together.

IDEA

The intelligence to do things better.

CASE

The future of software development is in your hands.

You already know the future. It's SAA.TM And CASE.

But you might not know that the future is already here—right within your grasp.

That's because the world's most widely used CASE technology—the Excelsior Series—is now part of IBM's SAA AD/Cycle offering.

Which means that today the Excelsior Series puts all the advantages of a proven CASE solution in your hands. Including better systems, higher productivity, and more satisfied users.

And at the same time, it prepares you to handle the development demands of the 90s.

We put SAA within your reach.

You don't want the systems you build today to be obsolete tomorrow—or five years down the road. So you need to start designing SAA-compatible applications now.

And right now, we'll give you the tools you need.

Choose a customized version of Excelsior that automates database modeling and design for IBM's DB2TM, and generates SQL. Or use another version of Excelsior that includes a two-way interface to CSP/AD, and lets you define complete CSP/AD applications.

In the future, you can count on more Excelsior solutions to help you migrate to SAA. Including a local design dictionary that will work together with IBM's Repository Plus smooth upward migration

from DOS to an OS/2 version of Excelsior that complies with Common User Access guidelines.

So the work you do with the Excelsior Series now—from building high-level data models to adopting more efficient development approaches—will continue to pay off as you move to SAA.

**Free: CASE DIRECTIONS magazine.
Plus a special SAA supplement.**

Find out how to prepare for the future with the Excelsior Series. Get a free copy of our 20-page magazine, CASE DIRECTIONS, with CASE histories and expert commentary; plus a special supplement on SAA. Call toll-free:

IN DEPTH

Dimming for dollars

'Lights-out' approach could help US West save \$1.2 million in data center operating costs next year and shift personnel to key areas

MURKIN/HAFN

BY LARRY MARSHALL

US West, a diversified \$9 billion communications firm based in Englewood, Colo., took the final step in automating its Albuquerque, N.M., data center more than two months ago. The Sept. 1 switch to a centralized operation control center capped two years of phased-in efforts to reduce data center staffing and improve staff productivity.

The project represents the first major step in a corporation-wide automation of US West data centers. Larry Marshall, project manager of automated operations and the moving force behind the Albuquerque effort, takes you through the steps.

The whole idea began around mid-1987 in an off-site group meeting, actually an after-hours

Marshall is project manager of automated operations at US West in Albuquerque, N.M.

bull session. A bunch of us, including the operations director, were sitting around talking about the difficulties of centralization and the number of people required to monitor the systems. We asked, "Isn't there some way to reduce the number of people by eliminating messages to the console?" A few months later, I latched onto a product brochure for an automated data center tool. "This is what we were talking about," I said. We were off and running.

US West was formed in 1984 from three Bell Telephone companies — Mountain Bell, Northwestern Bell and Pacific Northwest Bell. Last year, income from telecommunications and data services totalled nearly \$13 billion, up 12.6% from the previous year.

At the Albuquerque data center, our goal was to improve service, reliability and availability at the lowest possible cost. Many in the industry thought that system downtime stemming from human errors could be eliminated by automation.

Over the last two years, the

concept of automated data center operations has become very popular, especially with large organizations that are running anywhere from a handful to several hundred data centers. "Lights-out" data centers run computers with little or no human intervention.

The idea of computers running computers is attractive because in such cases, computers are faster than humans, make far fewer errors and cost less to run.

Moreover, mainframe systems are becoming increasingly complex to operate and there are shortages of experienced personnel. Coupled with a greater interest in managing geographically distributed data centers from a central site, the idea looks even more appealing. Reduced operating costs resulting from smaller information systems staffs also is a big plus.

The whole approach made sense to me. A typical mainframe in a data center can generate as many as several hundred thousand messages about hardware and software status in 24 hours. The large number of mainframe

systems and the need for round-the-clock monitoring contribute to the labor-intensive and error-prone data center operation. Like many firms, our goal was a data center without any staff at all — a "dark" data center.

At our facility, we employed 47 computer operators, who monitor and control a mixture of 40 computer systems located in Albuquerque, Denver, Salt Lake City and Bellevue, Wash. We wanted to reduce data center operating costs so that efforts and investments could focus on developing new applications. We also wanted to improve the quality of service and centralize data center management.

Walk before you run

Our first step was to get a small pilot project going. We set up several small clusters for a six-month trial that would determine the most effective methods and technologies to implement. Our premise was that our data center could be "staffed" around the clock by four computer operators.

We surveyed every person in the data center who performed a job that could be classified as "computer operations." Evaluators also observed each of our computer environments — minicomputers from Tandem Computers, Inc., IBM, Unisys Corp. and Unix-based Pyramid Technology Corp. — using a time-and-motion study technique and examined computer console log for each environment. We also continued looking at tools.

Tools for automated operations help a computer identify and respond to system console messages generated by a mainframe or attached minicomputer. The tool recognises system errors or requests and processes them according to a predefined set of rules. These rules may specify a response to the computer system, announce a serious condition, display a graphical representation of the

IN DEPTH: AUTOMATED DATA CENTERS

change in status or make telephone calls to support personnel.

Today, there are several automation products on the market, each focusing on different monitoring and control functions. Some products make voice announcements, offer a graphical representation of systems, interact with telephone systems, automatically restart devices and answer outstanding calls. Many tools, such as CA-Uncrack from Computer Associates International, Inc., AF/Operator from Claude Corp. and OPS/MVS from MVS Software provide services such as message suppression, automatic job scheduling and report management. Most products are, in one way or another, expert systems.

Preventive medicine

By using such tools, we wanted to be able to see the symptoms before the problem occurred. Specifically, we were thinking of ways to automatically restart lines, eliminate lag time and improve hardware and software availability. For example, if computer-line quality were degrading, we wanted to catch it before it was no longer usable. Automated tools, we discovered, are made exactly for this purpose.

After evaluating several products, US West chose a product called the Intelligent Console (TIC) from Votek Systems, in Thornton, CO. TIC is an IBM Personal Computer-based automated executive system/voice-program running DOS.

Because it is an "outboard" system, TIC did not intrude on our mixed-vendor mainframe operation. Because each computer manufacturer uses a different operating system, a common presentation helps smooth over many differences. We developed a uniform graphics display for each computer system.

We decided that the first stage of the plan would be to monitor a network consisting of five Tandem systems in Albuquerque, Salt Lake City, Denver and Bellevue. Albuquerque was the first center to participate in the evaluation. The initial cost for this phase was \$30,000 for the software plus the price of a Compaq Computer Corp. Desklpro 286 PC.

provide service.

At the end of November 1987, we began implementation. Two of our staff members were trained by the vendor opposite to set up the initial database on the PC.

Setting up the system was fairly simple. An analysis of the Tandem message stream determined which messages to throw away and which were critical. We looked at what action was required, defined the actions as well as the graphical display. The final step was to set up the expert-system rules.

Basically, the work involved systems design using a series of screens to manipulate the package. Users had two to four years of experience and some programming background. A technical analyst did most of the design.

The team set up TIC on the Desklpro 286, which was equipped with an audiophone, speakers and a microphone so that crucial system messages — such as "CPU SIX HAS FAILED" or "NETWORK COMMUNICATIONS LINE NO. 1 HAS BEEN INTERRUPTED" — could be digitally recorded on an internal disk and played back for a system operator during an actual problem. Besides vocal warnings, the new system would perform a variety of typical data center functions, including the following:

- Monitoring major hardware resources and notifying operational staff when critical error messages are received. Messages are sent by vocal warning, phone call or flashing red graphics.
- Notifying staff when various events indicate a need for preventive maintenance. For example, if the temperature or humidity anywhere on our seven floors of computer space exceeds the maximum level recommended by the vendor and

notifying operators that the system had failed.

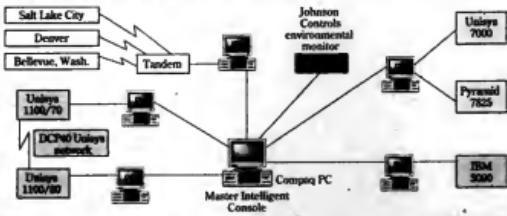

- Providing scheduling reminders for operational staff about predetermined tasks at specific times.
- Automatically signing on to the host computer and transmitting commands upon receipt of specific messages or when certain composite events are triggered.

In December 1988, we introduced TIC to our IBM 3090 environment. At this time, every environment in the data center was automated.

Besides pointing out significant cost savings and benefits of automated operations, our initial study also examined the issues associated with the future of automated operations at US West. The plan

Lights-out at US West's Albuquerque data center

A PC-based Master Intelligent Console oversees operations of Unisys, Pyramid, IBM and Tandem systems in one building, while directing remote Tandems in other Western cities

SOURCE: US WEST

COURTESY OF US WEST

The system will log all unusual operator actions for audit-trail purposes.

By March 1989, the automated system had been up and running for several months. Each of the Tandem data centers in the Western cities was unstaffed and monitored from the Albuquerque data center. Data center personnel were redeployed to more strategically valuable tasks, such as problem troubleshooting and assisting in applications development. The only manual intervention required was minimal tape mounting and monthly bootstrap loads. The next step was to propose the project to our Unisys systems operations staff. From March to June, we went through a long process of selling and educating the Unisys technical support staff. Fortunately, we had pretty strong support from data center management.

At first, the Unisys staff was concerned about the risks. Eventually, they became an ideal test site for a Unisys-wide trial. I assured them that they could implement the system without damage. During this time, we installed a new Votek product called Tieplex, which allows up to eight computers to connect to front-end processors, performs high-level message filtering and prioritizing and connects to TIC.

Unisys-to-Unisys link

Our efforts paid off. In June 1988, a TIC test system was introduced into the Unisys environment. We soon realized that an individual TIC system on an individual Unisys system didn't buy us much; we would still have a console and would simply be adding a device on the back. Eventually, we settled on a plan in which three Tandem systems were used to monitor eight Unisys 1100 mainframes, seven DCP60-based minicomputers and a mix of Unisys 7000s and Pyramid 9425s. After 30 days, the Unisys staff realized that the test was successful — it was a pretty impressive process.

At the end of a six-month test, the project was a huge success. We had saved nearly \$300,000 in data center operating costs and had redeployed personnel to more needed functions. More important, service and control were improved.

want to merge all environments into one central "Operations Control Center."

As part of our continued lobbying, we flew the Unisys department manager to San Diego for a meeting of the Association for Computer Operations Management that focused on automation. He saw that this was a hot topic and jumped on the bandwagon pretty quickly. Based on the successful trial, a decision was made to proceed with the implementation of the control center. The OCC would be a focal point for monitoring every computer system in the Albuquerque data center plus the remote Tandems. Establishing an OCC in New Mexico would also be the first major step in a corporatewide strategy for automating data center operations. Our goal was to have a functioning OCC by December 1989.

Beeswax as wood

The work of assembling the OCC began in February 1989. During the project, we deployed a total of seven US West "expert" computer operators to assist in the setup. On Sept. 1, 1989 — three months ahead of schedule — the OCC at US West's Albuquerque data center became operational. The switch-over was hardly a champagne event; business continued quietly as usual. No outages related to the OCC started occurring.

To oversee the OCC, a master intelligent console — a Compaq Desklpro 386 with a 25-MHz NEC color monitor — was set up as an overview system. It joined a mix of four other Compaq servers that served as local intelligent consoles for the Unisys, IBM, Unix and Tandem systems.

During the process, the US West vice-president of information technology visited our office. He invited us to attend a staff meeting with the president of his division. The idea of automated data centers was well received.

Automated data center operations at US West have nearly paid for itself in the first year of operation; the project has been self-funding.

Expenses for the project — including TIC software, 16 PCs, all furniture and cabling — totaled around \$750,000. So far, we have reduced data center

US West's Marshall checks a control console at the Albuquerque data center.

As part of the trial project, I wrote a cost-justification paper detailing what we could do with automated data center operations. Because he was part of the original half session, my boss had already signed on to the idea. The concept was then presented to the head of all data centers, then to top management. At this point, I did not even talk about saving people. Our main reason was to try to im-

prove disk-drive heads are going to crash, the system will notify building maintenance. It also will call an engineer to do hardware maintenance if necessary or if a specific device fails.

• Monitoring wide-area communications networks and initiating predetermined actions. In case of a line failure, for example, the system would automatically restart the equipment instead of simply

operating costs by \$700,000. Other payoffs include the following:

- Staff redeployed to more strategic areas. Labor-intensive functions were eliminated, and workers shifted to more crucial areas such as application and network management and software development. Seven former technical support staffers and computer operators were promoted to "knowledge engineers" in charge of maintaining expert systems databases. Others were reassigned to areas such as network operations and systems software support.

As automation progresses, some computer operators evolve into "operations analysts," who can help solve serious problems that management cannot handle. Their focus becomes finding the root of a problem, rather than merely taking immediate action.

As automation progresses, some computer operators evolve into operations analysts who solve serious problems that automation cannot handle.

• System is more centralized and easier to manage. The mean time volume has been reduced and the operator console standardized.

While US West has realized major benefits from its reduced-staff data center, there are still advances to be made. Automated technology is still in its infancy. The following are some of automation's biggest challenges:

- Eliminate labor-intensive functions. For example, a large volume of print processing still takes place in the data center. Until print can be electronically distributed to users or replaced by on-line inquiry, electronic funds transfer, electronic billing, optical disc or another approach, print handling will require personnel.

Hanging magnetic tape is another labor-intensive procedure. Through tape deduplication, which consolidates functions, people will be required to manage tape libraries until alternatives such as robotic-controlled media for high-volume data transport and backup are more fully developed.

We have begun exploring solutions at our Denver data center, including using tape stackers that can handle 10 cartridges, as well as robots using silo technology. We will look at using this technology in the IBM and Unisys environments in Albuquerque next year.

Even with full automation and lights-out data centers, workers are needed to manage and operate the automation tool, control the hardware and facilities, man-

age computer system software and perform complex problem analysis. Automation could remove those people from the "physical plant" but still require some staffing somewhere.

- Develop more sophisticated control software. Remote diagnosis and resolution of hardware device errors, which some vendors are beginning to address, is a problem. Also missing

is software that can power hardware devices on and off, which is now available.

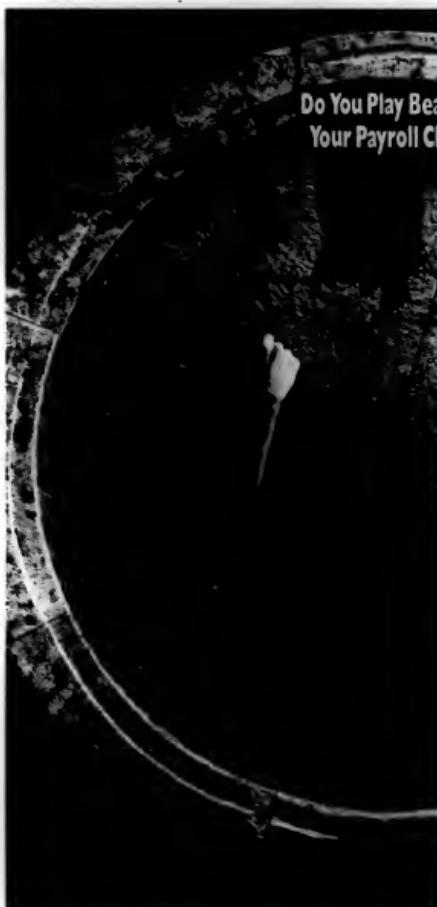

- Include noncomputing devices. To fully automate a data center, the automation tool must be capable of viewing the data center as a single entity, including environmental monitors. At US West, for example, TIC also monitors a Johnson Controls 85 environmental control system.

• Staff and management resistance. On the human side, dealing with displaced workers can be tricky. Some people often resist change and reassignment. Ditto with managers.

At US West, the current strategy is the first step toward global, strategic automation of the complete IS organization. We project savings of \$1.2 million from redeployed data center

personnel in 1990.

We are also actively pursuing "enterprise automation," which will integrate and actively manage all control information, further improving service and productivity. The ultimate goal is to provide cost savings from labor reduction and fewer software licenses as well as improved service and better-managed systems. *

Do You Play Beat-The-Clock To Get Your Payroll Changes In On Time?

ADP's PC/Payroll™ puts time on your side by giving your authorized personnel direct access to your payroll data right through your PC—instantly!

You'll never have to wait for input changes again!

At the touch of a key you can input, change, retrieve, validate and consolidate. Unlike many other payroll systems that make you wait a full payroll period to make even one change, PC/Payroll is a fully integrated system which lets you make as many changes as you want right on the spot.

It's easy and fast. What's more, you'll not only save time, you'll also increase accuracy and productivity in your payroll processing.

For instance, PC/Payroll's unique Report Writer feature allows you to directly produce inquiry reports from information stored in the database—in minutes! And the best part is, once you have the reports, they can be output to the screen, printer or disk file, and the formats can be saved and modified for future use.

And since change and growth are part of every company, we designed PC/Payroll with built-in flexibility to grow and change with your needs.

Let ADP make you a winner at beating the clock by giving direct access to your payroll instantly. For more information, call today, 1 800 225-5127, ext. 222.

Court: States may tax net traffic

BY MICHAEL SIEFFS

WASHINGTON, D.C. — A U.S. Court of Appeals last week upheld a lower court's decision that state taxes on Internet access violate the First Amendment.

Two Internet companies and two individuals sued the state of Maryland and the Commonwealth of Massachusetts, contending that certain taxes, according to them,

"are unconstitutional because they discriminate against speech based on its content." The court, however, rejected that argument.

Fear and loathing

Along with turtlenecks to the sleeveless, each November heralds the autumnal certainty that the computer whirred will once again begin slouching towards Las Vegas. For 10 years running, we've packed our travel kits, promised to call home and headed out for The Week of Rising Cholesterol Levels known as Comdex.

But perhaps it's time to reconsider exactly why we engage in this annual meeting of the tribes. Impossibly overcrowded and hideously spread out, Comdex has become — like religion and the lyrics to "Louie, Louie" — endlessly debatable. On the personal level, the most popular people rank the show just above a blow to the head. And the fact that it's held in steamy Las Vegas — where birds burst into flames in midair and sunsets curve openly on the street — only contributes to the confusion.

A very nonscientific poll I took last week found that at least four of the expected 117,000 showgoers trek to the Nevada desert for the same nonscientific reason: some little boys will blow up a frog with a firecracker — because it's there.

I find that difficult to accept but not impossible to believe. I have a friend, Linda, who, with whom she shares neighborhood cats not for any hunting commitment to rid the free world of felines, but because he thinks he is supposed to. But he also believes that porcupine squeak toys are life's pure pleasure.

Don't get me wrong: Comdex does bring its special joys. It not only provides a quick pulse check on the industry, but it offers a legitimate excuse to have the company spring for a couple of tickets to Ann-Margret's "Kitten" routine.

But the original rationale for Comdex is long gone, overwhelmed as it is by the one of its own. The important announcements now come in the weeks leading up to the show — witness the recent Hewlett-Packard and Compaq PC rollouts. One PR person even confessed that he'd never have

To CEO, polo is more than a shirt

BY NELL MARGOLIS
OF STAFF

HAMILTON, Mass. — "I'm a loo-oo-oo-oo," the Beatles croon on the radio inside of the horse trailer — but Bob Daniels, who is leaning against the trailer catching his breath and toweling off, is anything but.

On this 90-plus degree late September Sunday afternoon, Daniels, 49, has just led his polo team, Polar Express, to an overtime upset victory in what will be the next-to-last match of the 1989 season at historic Myopia Polo. "He went hard out there," Daniels says admiringly of one of

his teammates, toweling off a few feet away. "He really wanted to win."

Both are sensations. Daniels knows intimately — and not just on the polo field. Twenty-one years ago, armed with a new degree from MIT and the desire to do something pragmatic with it, he founded Project Software Development, Inc. (PSDI), which is now an approximately \$33 million project development software maker

based in Cambridge, Mass., that he still heads as chief executive officer.

PSDI's Daniels in a polo match at Myopia

In 1980, at the relatively late age of 40, he took up the sport that now takes up most of his spare time. In addition to the summer session at Myopia, Daniels and his string of eight polo ponies compete in West Palm Beach, Fla., between January and March.

Play on the fast field, Daniels says, helps keep him in the fast lane in proportion. On the other hand, he adds, "A lot of the qualities you need for polo are the same ones you need in order to run a company. You have to be calm, collected, deliberate.

Coming full circle to systems integration

BY RICHARD PASTORE
OF STAFF

ST. LOUIS — It seemed as if McDonnell Douglas Corp. had effectively clapped the wings of its computer operation this past summer when it announced complete and partial divestments of its Tymnet and computer systems divisions, respectively.

But one feather remained intact and unruffled — the company's nearly 30-year-old systems integration operation. And according to President F. Mark Kuhlmann, his group can actually do a better job with the other divisions out of the way.

Because McDonnell Douglas

had acquired the products of Tymshare, Inc. and Microdata Corp., "We started very much to make solutions on our own hardware with our own communication links," Kuhlmann told *Computerworld* in a recent interview.

But the company is finding that, more often than not, systems integration customers already have third-party platforms that they prefer to stick with. Consequently, the systems integrator has a tough time pushing the proprietary line.

"It gives you a greater degree of independence not to have all those [proprietary] pieces of the solution," Kuhlmann said.

As far as the systems integration operation was concerned, those pieces had become onerous and expensive. "They were not a critical element of my systems integration effort; from a strategic point of view, we did not see that we had to maintain them," Kuhlmann said.

The reorganized McDonnell Douglas Systems Integration Co. has turned back to the strategy it embraced from its inception until the first computer sector acquisitions in 1979 — providing value through a variety of means, proprietary or

Continued on page 112

Back to the future at McDonnell Douglas

It all began 30 years ago with systems integration. Now that's all that's left.

1979 • Acquires Microdata Corp. later renamed Computer Systems Co.; gains proprietary hardware platform.

1989 • Sells Tymnet to British Telecom.
• Relocates Computer Systems Co. to the U.K. Shaded to become independent company with partial McDonnell Douglas interest.
• Reorganizes systems integration as full business unit.

CIS trustee puts bids on ice, ousts management team

BY NELL MARGOLIS
OF STAFF

SYRACUSE, N.Y. — Continental Information Systems Corp. (CIS) founder, Chairman, President and Chief Executive Officer Harry Gotsmann Jr. and all but one member of the CIS board of directors resigned from their respective posts early this month.

The move leaves the court-appointed Trustee in Bankruptcy, James P. Hassett, in charge of the financially devastated leasing giant.

Hassett, who was appointed last month at the request of CIS creditors and shareholders, who pleaded a resounding lack of

confidence in the management team, hastened last week to assure both of these groups as well as end users of the firm's products that his arrival does not represent the end of CIS.

"Trustees come in all flavors," Hassett said in an interview with *Computerworld*. "I'm a financial, court-appointed reorganization trustee — not a liquidation trustee."

While he said he foresees as much as a year's reorganization work before any definitive conclusion can be reached, he was guardedly optimistic about CIS' long-term survival.

"This is a real company, with real people — some very capa-

ble people — as opposed to, say, OFP, which was a big scam," he said. OFP Leasing Services Corp. is one of several computer leasing companies whose reorganization he has overseen as a court-appointed trustee.

Gonsow bid new history

The advent of Hassett and the reorganization he oversees as the likely best alternative for creditors and users put pay to the plan of informal force Harold Gonsow, whose management-motivated bid to buy CIS out of bankruptcy is now history.

According to Hassett, the Gonsow-based management team whose strategic decisions were widely blamed for driving CIS into Chapter 11 earlier this year also jumped the gun in putting the company up for sale.

For starters, he said, "It's un-

known what tax liability the company may have; the CIS has now come along and is starting to levy taxes. No buyer would buy a company that has an undetermined tax liability hanging over it."

A further barrier to prudent bidders, Hassett said, is the fact that CIS "is not in a position to adequately value its assets. You can't sell what you can't describe — not without taking a big bath."

Earlier this fall, the consortium put together by Gonsow to acquire CIS offered \$420 million for the company, ICW, Sept. 14. A rival bid submitted by Boca Raton, Fla.-based computer leasing and investment company Platina, Inc., according to Platina Chairman Harold Von Arness, was preferred by the creditors' committee but given short shrift by management.

Daly

CONTINUED FROM PAGE 105

his clients introduce anything there. "They'd be crazy to," he said. "It would get lost in all the noise."

So what can be expected this week? The big news at last year's show highlighted the conflict between the Gang of Nine and IBM.

This year, on the other hand, we'll at least be able to see some of those new Extended Industry Standard Architecture machines.

In addition, there is sure to be some gum-flapping over Intel's flagship semiconductor, the 80486. Until a flaw was recently discovered in its design, vendors

eagerly threw their support behind the chip.

Now they approach it with the trepidation of kids standing at the edge of a pool in April; they'd love to dive in but the water is still a bit too chilly for their liking.

The fact is, the most interesting tidbit I've heard so far is that the show organizers at the Interface Group are building a new convention facility to accommodate Comdex's 8% to 10% annual growth rate. They'll also cut the show's 10 days down to four.

Maybe it's just time to accept Comdex as a necessary evil. For journalists, the weeks leading up to it are reminiscent of those grainy World War II films of the invasion of Normandy.

My colleagues and I hunker down in our landing ship, PR flask shells splashing in the water around us. When finally we reach the shore, the gangplank falls down, and we head out onto Las Vegas Boulevard in sensible shoes.

So as I pack my shaving kit and zip up the suitcase, I'm starting to wonder whether we've all been the victims of some elaborate scam. I'm starting to wonder if back organizers aren't sitting in some back room, drinking frozen daiquiris and laughing themselves sick. But that's a discussion for another day. Right now I've got to catch a plane to Vegas.

Daly is a Computerworld West Coast correspondent.

IN BRIEF

Still the downside

Prime Computer, Inc., early this month reported a \$104.8 million net loss for its third quarter — a figure that would have been recorded in black ink rather than red without a \$130 million pretax restructuring charge. Meanwhile, the company is already beginning to explore the possibility acquired liberty from its private ownership, Chief Executive Officer James J. McDonald said. "We've told manufacturing, 'Don't ship until you're sure of quality.'" A heavy heat enjoyed beyond the eyes of Wall Street? "Absolutely," McDonald said.

Deeper and deeper

Computer Sciences Corp. is negotiating to buy its way three steps — and approximately \$42 million — further into the commercial information technology consulting and systems integration markets, the company announced last week. On the other side of the bargaining table are Bechtel & Bechtel PLC subsidiary Cleveland Consulting Associates, Inc.; Minneapolis-based computer services firm LP8, Inc.; and consulting firm Infotech Ltd., based in the UK.

Asher to usher

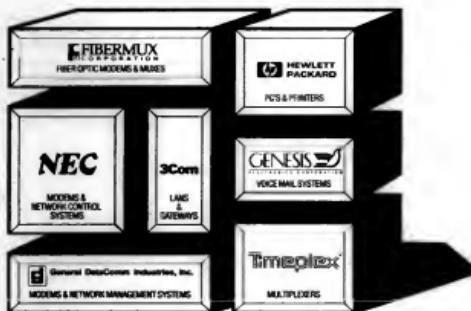

A comment solicitation aimed at disinterested Datapoint Corp. shareholder Martin Ackerman at unseating the company's board of directors ended last week. Datapoint Chairman Asher R. Edelman, an individual as well as corporate target of Ackerman's failed campaign, publicly declared the board "committed to maximizing the value of Datapoint shares for all shareholders."

DRAM deal

IBM and Dallas, Texas-based chip maker Micron Technology, Inc., signed an agreement last week under which Micron will license IBM's 4M-bit dynamic random-access memory technology. The deal, however, does not prohibit licensing of the relevant cache memory technology to unconnected IBM first — to other companies, including privately held competitor US Memory, which is currently involved in talks with IBM on just that subject.

Breather

Minicom Corp. has secured an extended temporary exception from the National Association of Securities Dealers, Inc.'s (NASD) filing requirements. The struggling disk-drive maker now has until Dec. 8 to file its 10-K for 1988 and quarterly financial reports for the first three quarters of fiscal 1989 or be removed from NASD's listing.

In the data business, sometimes it's better to mix and match.

At GTE, our data sales specialists and engineering specialists have researched, planned, designed, and implemented literally hundreds of data systems, large and small. Many times, we've found it more efficient to design a network by selecting state-of-the-art components from a variety of manufacturers. We MIX products and MATCH protocols, to meet your needs.

And when you finally make your purchases, our loyalties are with you — not to any particular brand name.

Besides knowledge and experience that spans the entire telecommunications industry, GTE offers one distinct advantage. We'll stand behind any data system we sell with our highly trained service staff.

When you're ready to select a data communications system, or upgrade the one you have, do two things.

Forget everything you know about shopping. And call your GTE Account Manager. GTE, the data communications systems integrator.

Imagine UNIX workstations as easy to use as a Macintosh.

Now they are reality. Intergraph announces the first easy-to-use workstations with the power of UNIX® and the simplicity of Macintosh®. That's because our workstations offer Looking Glass®, the first user interface for UNIX operated by icons and a mouse. Looking Glass, from Visix Software, Inc., is fully compliant with the new OSF Motif look-and-feel industry standard.

You don't have to learn complicated syntax. Everything's done with icons, pull-down menus, and interactive dialogue windows. And, with the context-sensitive help system and plain-language error messages, you don't have to keep referring to user manuals.

Looking Glass is user-configurable. You can modify more than 400 icons and create new ones as your needs change. Looking Glass is as powerful as it is easy to use. In fact, it's faster than command line shells for standard UNIX operations.

So, for all your system needs, choose the power of UNIX and the ease of Looking Glass, based on industry standards. Available from Intergraph, the acknowledged leader in applications solutions. Call 1-800-826-3515 in the United States, 416-625-2081 in Canada, 31-2503-66333 in Europe, or 852-5-866 1966 in Asia.

NCR's Exley on open systems and 1992

Charles E. Exley, president of NCR Corp., recently spoke with Computerworld Österreich's Gerhard Rainer in Vienna on DOS, OS/2 and Unix, with a special emphasis on Europe.

Do you think there is some rivalry between Unix, OS/2 and DOS?

I think there is some rivalry, but there are very big differences, so the competition is not entirely direct. First, Unix is a multi-user system, very different from DOS and OS/2.

Second, Unix is a portable system. Both OS/2 and DOS, as they exist today, are specific to a particular instruction set. In particular, DOS is specific to what one might call the "right simulator standard" of personal computers, which is a very confusing standard. Unix offers opportunities for system designers to be more creative in coming up with new and better hardware platforms. The best offering will be a hybrid offering, utilizing client server architecture, utilizing both Unix at the server and OS/2 or DOS at the workstations.

Could you specify your expectations for the growth rate or the installed base of Unix systems in Europe?

I would say, for some time to come, high double-digit growth rate for Unix installations. We are experiencing that kind of growth rates ourselves, and I assume others are as well.

What do you expect from IBM's increased activities in the Unix market?

I can't comment on competitors or what they are doing. What is significant is that major companies today have endorsed the concept of open systems. That is a tremendously important development. And it is very clear that open systems will be the central direction of the computer in-

dustry in the future.

Will IBM's movement toward Unix promote the operating system? Will it be an advantage to the whole Unix community?

[Without commenting on any specific company.] If you look at the five largest companies in America, they have all endorsed the open systems concept recently.

Do you see some problems for the Unix market because of the rivalry between the Open Software Foundation and Unix International?

I do. I think it is unfortunate from the users' and from the customers' standpoints. I would like to see these two groups brought together to form a common agreement on standards. I think it would be in the interest of the customer and the industry, too. We have made several attempts to bring that about, but up to now we have not been successful. The OSF was triggered by some events that raised a very understandable concern in the minds of a number of the people who then formed OSF. But I believe that all those concerns today can be answered by a unified organization. So I am still hopeful.

What are NCR's expectations in the common European market, and what developments do you see in the future?

I think the coming common European market will stimulate economic growth and be good for NCR, since we are basically a capital-goods company. We will be able to deliver those items for which quick delivery is important — for example, personal computers. The movement of goods

and the handling of central stocks of goods will be much facilitated. With respect to our employees and customers, we already operate on a one-world basis. We don't consciously try to appoint general managers who are nationals of the country in which they are working. Most of the time that's the way it works out, but we don't

teller machines, for which we are the world's largest supplier by far, are not sellable in Japan. We have to continue to be conscious of the fact that there are differences nationally in the market.

What part does your European business play in relation to your overall business?

We, of course, sell unfinished products, such as semiconductor devices and other kinds of components; but when you talk about finished-product sales, today Europe is our largest group — bigger than the U.S. in finished-product sales. Total non-U.S. business accounted for 58% of our overall revenue last year. And I expect over the next decade that the percentage of our business outside the U.S. will continue to increase to about 65%.

Will there be no growth in the U.S.?

I think there will be a fast growth outside [of the U.S.]. There are more

than five billion people in the world, but only 240 million in the U.S., so [non-U.S.] is bound to be a fast-growing market.

isn't it difficult for a hardware company with all the competition around, particularly competition from the Far East that can produce much cheaper components?

We have more competition than we need. Our basic strategy is that we want to do both. So, our development and production of units are divided into two groups. One group is called the general-purpose products group, and they provide the hardware. The other group — the integrated systems group — provides integrated systems both for vertical and horizontal markets. And the general-purpose products group sells its products to the systems integration division.

NCR's Exley: "We have more competition than we need."

NICKELS & DIMES

Measurex Corp. posted a 6% increase in net income for the third quarter of 1989 with revenue of \$72 million. Revenue for the period, which ended Sept. 3, increased 5% from \$68.3 million in 1988's third quarter. Net income for the quarter was \$10.1 million, up from last year's \$9.5 million.

Newbridge Networks, Inc. announced the results from operations for the first quarter of fiscal year 1990, ending April 5, 1989. Sales for the quarter were recorded at \$37.3 million (Canadian), representing an increase of 179% over revenue of \$10.2 million recorded for the first quarter of the fiscal year 1989. Net income of \$4.2 million for the quarter represented an increase of 695% over fiscal 1989 first-quarter net income.

Digital Communications Associates, Inc. reported earnings of \$7.1 million for its first fiscal quarter ended Sept. 30, compared with \$7.1 million reported for the corresponding period a year ago. Revenue totaled \$53.1 million compared with \$51.7 million for the corresponding quarter last year.

Olsen tells stockholders DEC will ride out recession rigors

BY RICHARD PASTORE
CW STAFF

BOSTON — Like a football coach trying to drum up team spirit after a couple of rough seasons, Digital Equipment Corp. President Ken Olsen last week told DEC stockholders: "This is by far the best recession we've ever been in."

Olsen backed up his rose-tinted observation by explaining that the computer in-

dustry recession is not worldwide, as the computer markets in Europe and Japan are booming. He also said that DEC's line of new products positions the company admirably.

Addressing the approximately 160 attendees at DEC's annual meeting of stockholders, Olsen reaffirmed his company's strategy of not giving ground in bad times.

"Every recession we've been in, per-

haps have asked us to cut back, to lay off people, to save. But we've always had confidence in our products and people. We're setting out to grow, not retreat." Early this month, DEC formally announced that a six-month wage freeze will end on Jan. 1. However, according to the company, tight hiring restrictions are still in effect.

Olsen conceded that the company's performance pales in contrast with the glory years that marked the mid-1980s. "Compared to three years ago, we're doing poorly," he said.

The software giant affirms it has enough DEC to hold the line on research and development investment. "We have to stop where we are. There's a lot more we'd like to invest in, but we're not," he said.

When pitted against other players in

the minicomputer field, however, DEC is doing well, Olsen said. "Most of our competitors are gone or almost gone," he said. "The contest is nearly over."

Flashed by products ranging from dumb terminals to the new VAX 9000 mainframe, Olsen could not resist boasting the sophomor.

"Eight years ago, the [Boston] Globe and *Business Week* wanted my head because they said I was too old to realize that PCs would wipe out minis and mainframes," he said. "They don't say that anymore."

Olsen also emphasized software strategy, specifically integrating the VMS and Unix operating systems and fostering software intercompatibility. Olsen said Unix promises to be the operating system around which an industry standard can arise.

Daniels

FROM PAGE 105

erate — you have to be competitive and willing to fight hard." Whether you are focused on the final goal or the bottom line, he says. "It's still the same old story — if you're doing nothing, you're doing something wrong."

Polo, he says, is not a pleasure into which one can dip occasionally. "People who get into it have to [be] ready to dedicate an incredible amount of time," he says. What's more, he adds, anyone bent on becoming an overnight sensation would be well advised to avoid the polo circuit.

"This is a very mental game," Daniels noted. "It can take seven or eight years as a player just to really tell how it works."

It also helps to have a taste for nonstop laying polo is kind of

like being a fighter pilot; a lot relies on reflex and second thinking." Another perhaps ironic similarity between Daniels' vision and avocation: "Despite appearances, the faster you go, the less dangerous it actually is." In polo, as in the computer industry, injuries are more likely to occur during slower phases. In his tenth season at Myopia, Daniels reports no broken bones.

At the moment, in fact, the injury risk may be greater for him when he takes off his polo uniform and gets into his business suit. Privately held PSDI, whose approximately 280 employees serve an estimated 15,000 private development users, has traditionally enjoyed annual growth in the ballpark of 20% or better. In this fiscal year, said Daniels, the company — still in transition from rental-based to sale-based revenue and shelling it out in the competitive software market — will not maintain

its accustomed batting average. In fact, a slight downturn in revenue is likely.

Daniels reacts to the rougher workplace game much as he reacted on the field when the Pony Express had fallen behind with seconds left in the chukker. "It wouldn't be very interesting if it were always straight up," he says.

For Daniels, polo is not just a challenge and a pleasure; it's a family occasion, figuratively and literally. Many entrepreneurs before him at the Myopia Hunt Club "In fact," said Daniels, "I met Jim McGowan, who's now the chief operating officer at PSDI, at Myopia. He's a player." If entrepreneurs abound on the playing fields in Hamilton, however, so do Danielses. All three of Daniels' sons — Kenny and Greg, both college students, and Marc, a sophomore in high school — have ridden competitively.

Steve Olsen, President of DEC, holds the East Coast Open trophy in 1988.

HP sets plan to cut 330 from Apollo division

BY NELL MARGOLIS
CW STAFF

PALO ALTO, Calif. — Hewlett-Packard Co. early this month announced that it will eliminate some 330 jobs at its Apollo Systems division as part of an "additional consolidation" of the two companies.

The latest cut, which will fall most heavily on Apollo's product-support operation in Chelmsford, Mass., and its manufacturing plant in Exeter, N.H., will affect administrative, marketing and research and development jobs, according to HP. It comes approximately six months after HP's acquisition of the workstation pioneer.

"It's hard to characterize whether this level is good or bad," said Peter Rogers, an analyst at Robertson Stephens & Co. in San Francisco. "One has to wonder why this is coming so far into the process. My sense is that HP has not moved as expeditiously as they could have, or should have, in integrating the companies. I think there have been some unexpected clashes in cultures."

Begging to differ

"Actually," said an HP spokeswoman, "we don't think that is late in the game." HP, she noted, acted promptly last spring to eliminate obvious redundancies, "but when it comes to repeat center functions, for instance, those are the kinds of things it takes some time to identify."

HP did not deny that the parent company's culture and that of its Apollo division are not an automatic perfect fit but said that a period of adjustment was both foreseeable and, in fact, foreseen.

"A lot of Apollo people were no doubt attracted to Apollo specifically because it was an entrepreneurial company; HP is No. 39 on the Fortune 500 without Apollo," the spokeswoman said.

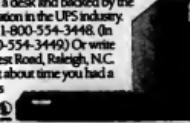

At the same time, power problems have only gotten bigger.

Today over half of all problems with small computers are power related.

With more than 25 years of experience in power protection around the world, Exide Electronics designed the Powerware Personal Series to provide on-line power conditioning as well as up to 15 minutes of emergency back-up power for a single PC or a network of small computers.

All Personal Series models are fully upgradeable, small enough to fit on a desk and backed by the leading service organization in the UPS industry.

Call us today at 1-800-554-3448. In North Carolina, 1-800-554-3449! Or write us at 3201 Spring Forest Road, Raleigh, N.C. 27604. After all, isn't it about time you had a power system that's as advanced as your computer?

Powerware Personal Series From Exide Electronics

Trusthouse Forte Hotels
sleep easier since AT&T
Computers checked in.

San Diego, California
April 27, 1989

Trusthouse Forte needed to automate its reservations and property management system so it could manage its properties more efficiently and improve customer service. AT&T and ABIT Authorized Value Added Reseller, Encore® Systems, Inc., created a solution for over 500 hotels by integrating the reservation system with a property management system. AT&T's Jerry Trapp and Encore's Mike Othen join Trusthouse Forte's Bill Harley to retell the story.

Bill: Dated. That's how I would describe our old reservation and guest billing systems. They just couldn't reserve rooms or bill our guests fast enough. On top of that, some hotels were manually booking rooms while others were running a smorgasbord of property management software packages.

Jerry: Because nothing was plugged into your central reservations system. Your guests were not getting the service they deserved. And it was driving your hotel managers nuts as well.

Bill: And when your customers don't get service, that's when you lose their business. You can see why I needed a lodging expert like AT&T, who understood my business well enough to customize a bulletproof solution to it. Who could seriously integrate software and hardware without trashing the huge investment I'd already made in my current system.

Jerry: You needed to turn the dated system into something you could really use. Fortunately, AT&T has solved a number of problems like yours in the lodging industry. And we chose to team up with another lodging pro like Encore Systems, Inc. Together we could really zero in on your special software demands.

Mike: That's right. We knew right off

that you needed a lot of flexibility built into the system. For example, it had to be able to be used at any size hotel—from 40 rooms to 400.

Bill: Which is critical. We want the smaller hotels to get as much out of it as the large hotels. And they are. Now our hotels have the ability to create guest profiles. Plus customer billings from restaurant to phone to movie charges are all automated. Now our managers can spend more time on their most important job—keeping our guests happy.

Jerry: Another nice advantage is that they can, in seconds, interactively reserve rooms all over the world. And then monitor and report results back to headquarters. So headquarters, in turn, can use that data intelligently for designing future marketing programs.

Mike: The quality of service you're giving your guests is soaring.

Bill: You said it, Mike. In fact, we've heard good things from the hotels that have the system rolling. Service standards are better and reservations are made in a flash. And satisfied guests are what we want most in this business.

third party.

Kuhlmann and the company will put a much greater emphasis on third-party products. "We will move from almost 100% proprietary solutions to a blend of maybe 50% third-party solutions," he said.

To back up this change, McDonnell Douglas is aggressively cultivating third-party alliances. It already has pacts with Digital Equipment Corp., Oracle Corp. and Hewlett-Packard Co.

Analysts agreed with Kuhlmann's assertion that the proprietary lines were hampering rather than helping integra-

tion efforts. The idea of pressing an integrated group of proprietary systems on customers never really gelled, said Jerry Cantwell, an analyst at Wertheim Schroder in New York. "It was frankly not exactly what the world was looking for," he said.

In the wake of its restructuring as an independently functioning business component of the parent company, Systems Integration Co. has installed a new executive team.

Its nine members, announced last week, have been charged with improv-

ing the efficiency of day-to-day operations.

One step already under way is the consolidation of once-separate customer operating sectors such as computer-aided design and shop-floor manufacturing into one group that will focus on the broader customer market of manufacturing.

Analysts agreed that the divestment and organizational changes should lead to more focused support of the integration business.

In addition to a trend toward third-party plat-

forms, Kuhlmann sees customers becoming more interested in companywide, as opposed to departmentwide, integration.

"Before, the thrust was to automate the functionality within a department with stand-alone systems," he said. "We're now looking at an enterprise approach."

Kuhlmann disagrees with some industry claims that outsourcing is no longer an important service that system integrators should offer. McDonnell Douglas will target its outsourcing services to companies undergoing buyout or spin-off transactions. Such firms "do not want to devote resources to building a data center," he said.

"For them, I think outsourcing is precisely what they need to do."

Kuhlmann encourages companywide integration

Not All Software Giants Start Out In California Garages.

Take us, for example. We started out in Dortmund, West Germany, providing computer solutions for the \$3.4 billion industrial giant, Hoechst. Not exactly a garage. *Independent Since 1957.*

We became an independent (but windily-owned) subsidiary of Hoechst in 1957. Which means, among other things, that we were already in business when a byte to Bill Gates was still a form of leaching.

Today we're a \$70 million company, bringing high tech expertise in COBOL, office automation, data processing, computer-aided design, communications, and process control to major corporations all over

the world, from offices in fifteen countries.

Experts in COBOL

One example of our expertise is Visual COBOL, an ANSI/45 COBOL compiler with VS COBOL II extensions that generates true native code for micros in a variety of environments, including UNIX, DOS, OS/2 and others.

Visual COBOL is a full-featured compiler which includes such productivity tools as Visual Debug, Visual Assistant and Visual SMS. A WYSIWYG screen management system that automatically handles screen displays, color and attribute changes, cursor positioning, data IO

and windowing. Visual SMS alone spares programmers the need to write hundreds of lines of code. Access to all compiler functions—Edit, Compile, Link, etc.—is handled by a menu-based interface, so all primary functions are only a keystroke away.

For more information, a free demo disk, or a 30-day product evaluation, contact us at 800/231-6342, or 800/346-4846 in California. Call 415/769-5333 from outside the U.S. Or FAX 415/769-5735.

NEC merger seeks to unify product lines

BY ELLIS BOOKER
CW STAFF

WOOD DALE, Ill. — Pulling down the barriers between its computer and consumer peripherals groups, NEC Corp. began the month by merging NEC Home Electronics U.S.A., Inc. and NEC Information Systems, Inc., based in Boxboro, Mass.

The parent company said the new \$1 billion entity, NEC Technologies, Inc., will also be based in Boxboro and will seek to unify NEC's product lines, which stretch from laptop computers and peripherals to videocassette recorders and video games.

Richard M. Underwood, former president and chief executive officer of the information systems group, has been named chairman of NEC Technologies; Yuki Oshaki, former president of the home electronics group, will be president of the new enterprise. NEC plans no layoffs or layoffs resulting from the merger.

The former home electronics operation in Wood Dale, with its 1,100 employees, will handle personal computers, monitors and compact disc-only memory drives. The Boxboro operation, which employs approximately 1,600, will handle personal computers, printers, disk drives and modems systems.

NEC said there would be no structural changes at the current Home Entertainment, Audio/Video and Professional Systems units, also based here, nor at the Automated Fingerprint Identification unit in Washington, D.C.

Miles Andersen, former executive vice-president at the information systems group, will be executive vice-president at NEC Technologies. Keith Schaefer, former senior vice-president at the home electronics group, will become senior vice-president of the merged company.

Bruce Stettini, who tracks the laptop market for International Data Corp. in Princeton, N.J., said the merger was necessary to prevent "cannibalization" between product lines at the two units.

"NEC Home Electronics was producing more and more powerful laptops, and IS was expanding its transportable line," he said. "It was only a matter of time before the two began to compete."

COMPUTER CAREERS

Are MBAs really that vital?

Solid work experience can garner as many points as an advanced degree

BY JANET MASON
SPRINGER TOOW

Although some bill it as the key to the executive suite, a master's degree is business experience that guarantees career advancement for the information systems professional.

In some companies, particularly large corporations and consulting firms, an MBA can open the door to management or bring a larger starting salary. However, in most hiring and promotions, experience is weighed far more heavily than an MBA, according to a number of observers. The value of an MBA thus lies in parlaying the education into solid business experience.

Consultants and recruiters express a wide range of views on the value of an MBA. William Popper, a principal in Index Group, Inc., Cambridge, Mass., a consulting firm, contends that an MBA is the crucial first step toward management.

"In many companies, the MBA is the ticket to management. You won't get the position without it," Popper says.

Popper notes that techniques for automating software development, such as computer-aided software engineering, call for systems developers to possess a

greater understanding of their company's business. Increasing use of such tools should lead IS organizations to place a growing value on employees with a business education, he says.

John F. Roddy, director of the Center for Information Systems Research at MIT's Sloan School of Management in Cambridge, Mass., contends that an MBA can help IS professionals move into line management, increasing their mobility and earning potential.

A large consulting firm, an MBA can clearly help technical professionals understand applications from the user's perspective, says Charles Emley, partner in charge of information technology consulting at Touche Ross & Co. in Los Angeles. Approximately half the people Touche Ross hires have just received an MBA, while the others are hired primarily for their work experience.

Other observers emphasize that work experience can outweigh formal education. "The MBA is no ticket to IS management," says Roger Sobkowiak, a partner at Software People Concepts, Inc., a New Haven, Conn., recruiting firm. If the choice is between an IS professional with an MBA and

one with solid experience working with users, the one with the experience will be chosen for a position, he says.

At Boeing Computer Services, a division of The Boeing Co. in Bellevue, Wash., IS professionals are encouraged to obtain MBA-like other degrees, through a tuition reimbursement plan. The broader outlook they acquire with an MBA can help them better understand decisions made in the company, says Elaine Delappe, the division's manager for human resources support services.

Workers who pursue an MBA can put their newly acquired knowledge to work and might take on more responsibilities and move into management more quickly, deLappe says.

"But once they get an MBA, there's no magic," she says.

"They are not automatically put on a management track or given a pay raise," Boeing Computer Services does not overly encourage an MBA the way it would promote an employee who earns an undergraduate engineering degree.

An MBA can be a tiebreaker in decisions on promotions or hiring, especially at large corporations where the credential

may be more highly valued, says Cameron Carey, president of Computer Security Placement Service, Inc., a recruiting firm in Northboro, Mass. "It's usually better to have one than not have one," he says.

However, the most important factor in furthering a career is to possess a clear direction, accord-

ing to Carey. "It's equally important, and it's just not," Carey says.

Observers differ as well on whether an MBA can help boost earnings in the IS field. Sobkowiak says it will not enhance them dramatically.

Emley says consulting firms tend to place more value on MBAs than do corporate em-

ONCE THEY GET AN MBA, there's no magic. They are not automatically put on a management track or given a pay raise."

ELAINE DELAPPE
BOEING

ing to Carey. "The person who doesn't have a clear vision, who's just going to get the MBA because it seems like a good idea, ought to forget it. To go in willy-nilly and just do it to get the sheepskin is going to be time wasted."

According to Carey, an MBA program can acquire students with the right disciplines of business, providing the background with which to focus career goals more sharply. "But that could be done in a business library as well," he says. "I feel one needs more purpose than that to justify the expense of time and money."

For people who opt for an MBA, work experience still can be important as a prerequisite. "Without it, there's a tendency to treat everything in school as if

players. Take, for example, a corporate IS employee with a technical undergraduate degree and three to five years of experience, earning about \$60,000 a year. By completing a "first-class" MBA program, he might boost his pay \$5,000 to \$10,000 at the corporation. However, if he moved to a consulting firm after completing the MBA, he might increase it by \$10,000 to \$15,000, according to Emley.

"An MBA can give IS people a greater starting salary, but as they gain experience the premium shrinks," says Thaine Lyman, another Touche Ross partner. "A person with 10 years of experience has no reason to obtain an MBA," he says.

Lyman is a Philadelphia-based finance journalist.

Data Processing Professionals Career Opportunities

Orlando Regional Medical Center is a leading 1,100-bed, modern facility, serving over 200,000 annual outpatient visits. Our Information Services Department is currently expanding and is in need of experienced individuals with demonstrated expertise in healthcare computer software design, development, implementation, and support.

We are seeking Application Software Professionals for positions ranging from Programmers to Systems Analysts. Successful candidates will have experience with IBM 3690 MVS mainframe or DEC VAX/VMS systems, and will be competent in a combination of COBOL, CICS, IMS/VS, PC/ADS, and AS/400/EASYtrieve. Individuals must have excellent communication skills and a desire to work across organizational boundaries.

In exchange for your talents, we provide an attractive salary/benefits package and the added benefit of Central Florida living where you will enjoy an array of recreational and entertainment opportunities and no state income tax or none.

For immediate consideration, please forward a copy of your resume to: Orlando Regional Medical Center, Department of Employment Services, 1444 Edgewater Drive, Orlando, FL 32806. An Equal Opportunity Employer.

Hardware/Software engineers — Add SPARC to your career!

ICL is AT&T's and Sun Microsystems' development partner for UNIX V.4 on SPARC-based minicomputers and will be providing the reference port. Join ICL and contribute to this leading-edge development of industry standard systems!

ICL North America was formerly CCI Computer & Processor in UNIX-based minicomputers. International Computers Limited is the largest computer company in the U.K. with 1988 revenues of \$2.3 billion.

ICL's Technology Development Center in Irvine, California is looking for:

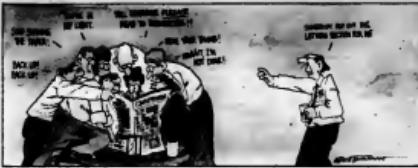

- SENIOR UNIX KERNEL PROGRAMMERS
5+ years UNIX kernel and RDBMS experience; performance tuning the interface between RDBMS and UNIX kernel.
- HARDWARE ENGINEERS
3+ years developing firmwares and diagnostics for high-performance processors and I/O controllers.

ICL offers attractive benefits and compensation. ICL is an Equal Opportunity Employer M/F/V/H.
For confidential consideration, send resume to:
John Fawcett,
ICL North America,
9801 Mulholland Blvd., Irvine, CA 92718.
Call John Fawcett at (714) 455-7262.
Fax transmission upon request.

Our systems are up. So log in.

Bring us your computer language skills, a talent for communication, and the desire to do something important and we'll give you an opportunity to make a significant contribution.

Because right now, Boeing Computer Services, a division of The Boeing Company, is looking for the brightest people to help us provide world-class information services to hundreds of commercial and government customers.

We're growing, expanding and doing important work in a broad range of computing disciplines.

So check out the opportunities. If your skills and experience match our requirements, get in touch.

Here's What We Need

The following positions require an EE, ME, or BS or Computer Science degree and appropriate industry experience. We will also consider talented entry-level engineers and computer specialists with advanced degrees.

Applications:

Financial, Manufacturing, Engineering, Logistics, Embedded Software, Expert Systems, CAD/CAM, Neural Networks

Software Packages:

CATIA, McCormick-Dodge, Microsoft Windows, CASE tools, X Windows, Powerhouse/Trans Act

Hardware:

IBM, CRAY, HP DEC/VAX, Apollo, SUN, TANDEM, WANG/VIS

Communications:

LAN, Network Architecture, Novell, X.25, MAP/TOP, Ungerman Bass, Cable Plant Engineer, Protocol Layer Evaluation/Design, Network Hardware

Language Experience:

Ada, C, COBOL, Fortran, PL/I, SQL, Pascal, Assembler/BAL

Operating Systems:

MVS, UNIX, CICS, DOS, VMS, NOS, CDS

Database Experience:
IMS, DB2, Microrim, Ingres, Paradox, ORACLE

Software Engineering Skills:
Data Modeling/Data Management, DOD Standard 2167, System Architecture, Software Testing, Systems Engineering, Capacity Planning/Performance Tuning, Integration Engineering

Operating Systems Analysis:
Experience in operating systems of IBM, Digital (8000 series) and HP (3000 and Spectrum series).

Factory Automation Software Development:

Integrated OSI communications (MAP/TOP), manufacturing and business operations in a CIM environment which makes exclusive use of multi-vendor platforms (digital, HP, Intel, LAN & WAN systems).

IMS Programmer Analysts:

Experience designing, coding and implementing on-line and batch business systems in an IBM mainframe environment. Proficiency in COBOL, IMS DB-DC, JCL and TSO/ISPF required. Knowledge and experience with Micro Focus workbench a plus.

IMS Data Base Administrators:

Command of all IMS data base related functions. Performance analysis, space management, problem resolution and logical/physical data base design skills are essential.

IBM R10 Programmer/Analyst:

Requires proficiency in use of IBM 8100 hardware and software products. Desirable experience includes DPX/SP operating system, DPX/COBOL, DTMS, TSO, CLISTS, host communication facilities and structured programming.

Programmer/Analyst:

Programming experience using Tandem computers, knowledge of COBOL, SCOBOL, DDL, Inspect, Enable, TME and Pathways required. SQL and TAL background a plus.

NC Programmer For 3-Axis Machines:
APT language for interactive graphics programming on CAD/CAM. CATIA experience a plus.

Operating Systems Programmer:
Internals experience in one or more of UNIX, MVS, VMS, NOS, or COS operating systems. Ability to solve system dumps and design new operating system products.

Here's What We Can Do For You

These positions offer excellent growth potential along with the right salary, relocation assistance and these benefits:

- Company-paid plans for Health Care, Vision, Dental, Retirement
- Company-sponsored Training Programs (on/off hours)
- Investment Plans (VIP/FSP)
- Continuing Education Program (reimbursable)
- Employee Suggestion & Cost Improvement Programs

We can offer you another plus — a chance to share a quality lifestyle in the beautiful Pacific Northwest. Near Seattle, the number-one ranked city for recreation, and one of the nation's most livable cities, as well.

Here's How To Get In Touch

If you have what it takes to make our team, please send your resume, with current and expected salary, to **Boeing Employment Office P.O. Box 3707-PBP, Seattle, WA 98124**. Principals only.

Or fax your resume to our 24-hour fax line in strictest confidence: 1-800-525-1036.

Please note on your resume which job you are interested in.

An equal opportunity employer.

If you're a results-oriented pro who thrives on challenge and possesses strong macro-CICS experience, you could be part of a developmental project in a whole new technology. One that involves creating highly efficient programs that will revolutionize the way of transferring Alexander Graham Bell's invention into the talk of the 21st Century.

Specifically, we're referring to a joint venture of American Express Information Services Company and AT&T. Together, they have created a new Internet-based, a revolutionary new information service that makes money-making principles with advanced communications networking capabilities.

Working in an extraordinary environment which utilizes IBM 3090 and Amiashi 5800 processors running CICS and MVS/IXA, you will design, code and test specialized software programs for generic systems. You will also be responsible for maintaining, modifying and update the campaigns as needs and technology change. The scope of the assignments demand a minimum of 2+ years on-line assembler programming experience with macro-level CICS Facility with CICS Tables and Control Blocks are essential.

The professional advantages of tackling projects that will define this exciting new technology are enhanced by an array of personal benefits. Benefits include: relocation, you'll enjoy a high quality life-style in an area known for its low cost of living and its balanced, especially when you take into account the excellent school system and the vast beauty of the plains.

If your background is macro-CICS, it doesn't get any bigger or better than this. Arrange an interview appointment by sending a resume in confidence to: CALL INTERACTIVE, 216 E. 17th Street, Suite 300, Dept. AP, Omaha, NE 68104 or call Jeff Brummett at 402) 468-2292.

CALL INTERACTIVE™

A joint venture of American Express Information Services Company and AT&T.
Equal Opportunity Employer

It's Not A Good Match... Unless You're In TANDEM

You and CoreStates working together—developing new systems for electronic funds transfer, ATM, point-of-sale processing and PC connectivity.

TANDEM is your specialty; you could work with us. We'll provide you with all the technical and administrative support you'll need to help us set the pace for the next breakthrough in electronic banking. We currently have TWO Programmer/Analyst positions available to work in our exciting, advanced developmental environment.

ATM and POS NETWORKS—CoreStates owns and operates the largest regional ATM network in the nation. We are MAC. And we service more than 800 financial institutions in seven states while increasing our network every year.

IFT SYSTEM—Integrates and automates our wholesale electronic payment system, allowing us to automatically monitor and control the flow of large dollar transactions in a real-time environment.

Both positions require experience with non-stop TANDEM architecture supporting on-line transactional processing applications. TAL language skills highly desirable. A background in data communications and/or applications would be a plus.

Interested? Consider all the benefits a CoreStates' career will bring you. Send your resume with salary history requirements to: Vidal Brown, CoreStates Human Resources, P.O. Box 3-24-THEM, P.O. Box 7616, Philadelphia, PA 19101-7616. An equal opportunity employer.

CoreStates

PROGRAMMERS

"We'll be running a regular recruitment advertising schedule in Computerworld to get the results we need."

— Steven Tully
President
Brannon & Tully, Inc.

A custom software development company in Norcross, GA, Brannon & Tully, Inc. provides contract programming/consulting services to a diverse client base of Fortune 500 companies, utilities, and communications companies. President Steven Tully knows that building a staff of experienced professionals is key to the company's ongoing success in developing solutions-based software for specific applications.

"Because our recruitment advertising plays a vital role in finding the seasoned professionals Brannon & Tully needs, we have to expect one thing. Results. That's why Computerworld is the only trade publication we use for recruitment advertising.

"Of the over 50 professionals we hired in the past 18 months, over one-third came from Computerworld's pool of qualified readers. At our present growth rate, we're expecting to double our size in the next 18 months. That means we'll be looking to augment our staff with more and more industry,

applications, software, and programming experts to meet the growing demand for greater project diversification.

"With Computerworld, we know our ads get read by a very large audience of seasoned IS professionals. Because these professionals are not industry or hardware specific, we get a larger base of qualified professionals to choose from. We also get national reach. In fact, within the last six months alone, we recruited two candidates who moved all the way from California to the Atlanta area.

"In other words, recruitment advertising in Computerworld draws bigger numbers.

Computerworld. We're helping serious employers and qualified information systems, communications, and PC professionals get together in the computer community. Every week. Just ask Steven Tully. For all the facts on how Computerworld can put you in touch with qualified personnel, call your local Computerworld Recruitment Advertising Representative today.

Executive Director

Ohio Library and Information System (OLIS)
The Office of One Station on Executive Avenue has its new Ohio Library and Information System (OLIS). The state-of-the-art system will enable Ohio's major university libraries to share their collections and services. It will accommodate more than 17 million volumes. OLIS will also provide universal access to the rapidly increasing array of information sources available on computer networks. And students from participating universities will have direct access to the collections of materials held by the state's prime academic libraries.

Qualifications:

- Ten years progressively responsible administrative experience
- Familiarity with the issues of implementation and management of large-scale automated information system serving and users
- Ability to direct a staff of library and computer professionals
- Ability to negotiate complex technical contracts with vendors and suppliers
- Demonstrated leadership role in the field of end-user implementation
- Superior communication skills, ability to interpret and communicate complex material to a broad audience, and ability to encourage the OLIS team to the highest standards

Desired:

- ALA-accredited Master's Degree in Library Science
- Good proposal writing and administration experience
- Salary:**
- Very competitive based on qualifications and experience
- Position available July 1990.
- To apply, send resume and applications should be received by January 21, 1990.
- Preliminary interviews may be scheduled at the American Library Association Mid-Winter meeting, January 1990, Chicago.
- Applications, communications and inquiries should be directed to:

E. Garrison Watters
Associate Vice Chancellor
for Graduate & Special Programs
The Ohio State University
3600 Staff Office Tower
30 East Broad Street
Columbus, OH 43260-0417

MARKETPLACE

Window shopping with a PC

To get information, let your modem meander through an on-line service

BY JESSICA KEYES
SPECIAL TO CW

You are searching for the perfect printer. You have to go to the local computer store and learn about five, maybe six, different models. Back at the office, you leaf through a stack of computer magazines and see page after page of glossy advertisements. Decisions, decisions. How can you make an intelligent choice when you are faced with this wealth of information?

Does this situation sound familiar? Isn't that the reason information systems people pay their trade? Our mission is to present information so that people can use it to make intelligent and informed decisions. We seem to be dealing with a case of the collector's children wearing no shoes.

Fortunately, our personal computers can deliver the shoes. With little more than a modem and an access code, we can survey just what is available in hardware and software from the comfort of our chairs.

From Freddo to Freud
On-line information services such as Dialog Information Services, Inc., in Palo Alto, Calif., and CompuServe, Inc., in Columbus,

Ohio, can help us keep up with the frantic pace of technological change and the surge of product announcements.

Dialog touts itself as being the world's largest "knowledge bank," with information on subjects ranging from agriculture to psychology. Its Computers and Electronics Knowledgebase is a collection of six databases containing reviews, articles and announcements on mainframes, minicomputer units and PCs as well as business software.

Search-string service
The costs of accessing these databases vary but typically amount to about \$1.75 per minute; a typical search takes 10 or 15 minutes. With such pay-for-use charges, it is best to format your search string before you access the service. A \$149 software package from Dialog permits you to format and edit your inquiries rather than incur the cost of making mistakes on-line.

Let's say that during a half in office activity, you decide to look for reviews or descriptions of computer games. You enter "Begin Comp" to access the microcomputer index. Dialog responds with a confirmation that you are indeed in the right database. At the prompt, you enter

your search string: "Find Game? and Review? and Apple II?"

The system responds with "S153 Game? and Review? and Apple II," meaning there is a set of 153 references that match your criteria. You can now list these references or narrow or widen the search by asking another question such as "Find S1

WITH LITTLE more than a modem and an access code, we can survey just what is available in hardware and software from the comfort of our chairs.

and JN = Computerworld." by an SOS command). IQquest has many different databases covering computers and business.

Another well-known pay-for-use service is CompuServe. Its Computer Database Plus provides access to tens of thousands of articles from hundreds of publications. The search capabilities are less sophisticated than those of Dialog, but this service is much easier to use, costs \$12.80 per hour for connect time plus a fixed \$1.50 per month and provides more full-text articles.

Recently, a friend asked me to locate some information on add-on boards for the IBM PCjr.

Since PCjr. has not been sold in years, it is nearly impossible to find any add-ons at local PC dealers. CompuServe was my way out. I entered the search string "IBM PCjr" and Computer Database Plus found six entries. By displaying the menu of matching articles, I was able to get the information I needed.

If Computer Database Plus does not solve your problem, CompuServe's IQquest service may do. IQquest is a research and reference service complete with on-line Help (aptly accessed

Searching the on-line databases, you specify the tool you would like to purchase. You then search for articles that discuss other companies that have tried CASE and the merits of CASE tools. Armed with them, you make your case for CASE. Your firm's management is impressed with the information that you have compiled and grants your request. Case closed.

The computer marketplace is huge, and there is no way for buyers to keep abreast of its constant changes. Delivering systems that are innovative but also reliable and cost-effective requires research, and research requires the proper tools. Why not practice what we preach and automate the process?

Keyes is president of New Art, Inc., a management and computer consulting firm in New York, and formerly managing director of technology at the New York Stock Exchange.

IBM 3X and AS/400 equipment at IPL prices

Most people know IPL Systems as a provider of cost effective alternatives to IBM in on-premises products. What they may not know is that IPL Systems offers IBM products at the best prices in the industry.

In fact, if you send IPL a written quote on any IBM product in stock, IPL will beat the quote as well as ship within 24 hours under Net terms. All IBM products sold are guaranteed to be covered under your IBM or third party service agreements.

We even welcome you to try any product for up to 7 business days with no obligation to purchase. Don't pay more than you have to!

IBM 3X Memory (3X), AS/400 II Tape (3X), AS/400 II Shared (3X), AS/400

TRAINING

Identifying unknown problems

Highlighting needs through critical incidents can facilitate training

BY STEWART L. STOKES JR.
SPECIAL TO CH

The need for a needs analysis before launching a training program is an article of faith in most information systems organizations. And well it should be: as the saying goes, a problem identified is a problem half-solved. However, there's the rub — a conventional needs assessment may fail to uncover an organization's real training needs, especially when it comes to deficiencies of management and interpersonal skills.

This situation is aggravated by the fact that in many IS organizations' managerial and interpersonal skills are in short supply: IS professionals tend to know more about data communication than human communication. However, when it comes to bringing systems projects in on time and under budget, it is still the people skills that make the difference.

Where does this leave the IS professionals who are responsible for analyzing an organiza-

tion's need for people skills? I recommend they try to tackle them with the help of an analysis based on "critical incidents."

Consider this example:

The director of an IS department asked me to design a program of instruction in management and interpersonal skills for his project managers.

"They know all about project control tools, and they believe that all they need to know," the IS director said. "What they are missing are the people skills." This is typical of project teams where people usually collaborate rather than settle for a length cooperation. But I do not know what skills they need in order to build and manage collaborative teams. In all honesty, I am not good at doing that myself."

At least this IS director was honest and objective, and that is a great place to start. I worked closely with the IS training people to design and conduct a critical incident analysis. The process is based on the belief that while we may not know what we need, we do know what we are trying to accomplish, and we

know which critical incidents are hindering us and which are helping us in trying to achieve our goals.

We first identified the departments and other groups that worked with the project managers and their teams. These included users, senior IS man-

addition to the focus groups, I interviewed the project managers, posing similar questions.

The results: Each of the groups had ideas reflecting difficulties the project managers experienced in handling interpersonal relationships.

In negotiating project requirements, for instance, conflicts arose and then escalated. Several participants also pointed out that they were continually covering the same ground in project meetings. "No wonder we

real messages is human communication and provide constructive feedback.

Also apparent was the need for the project managers to understand more about the business requirements that their projects were designed to address. The project managers found it difficult to get close to the users because they did not understand their business environment. The result was a widening gap in relationships between IS people and users.

Of particular significance was the fact that none of the project managers thought that they had any need for training in conflict management, effective listening or business awareness. When faced with the results of the discussion however, they realized that their own perceptions were not as important as the perceptions of their colleagues.

The final step was to design and conduct a program of education in management and interpersonal skills based on these deficiencies. This step never would have taken place had we been content to merely ask the project managers, or their director, what they needed.

Stokes is a senior vice-president of CEO Information Sciences, Inc. in Wellesley, Mass.

MSA Trainer

for a major national organization headquartered in Washington, D.C.

Price Waterhouse has been retained by one of our major clients in Washington, D.C. to assist in the search for a qualified MSA Financial Systems Trainer.

The successful candidate will be responsible for all staff training and user support relating to MSA's Government Series software, and several in-house developed financial systems. This is a highly visible position and calls for significant MSA Financial Systems experience which should include designing and conducting MSA-related training programs. A B.S. degree, strong communication skills and a self-motivated disposition are also required.

The client offers a highly competitive salary, an excellent benefits package and relocation assistance.

Please send your resume, including salary requirements, in confidence to: Price Waterhouse, 1801 K Street, N.W., Suite 1000, Washington, D.C. 20006, ATTN: JRM.

The client is an Equal Opportunity Employer.

Price Waterhouse

We Cover All the Bases.

For over 16 years, On-Line Software has provided the finest software training to IBM® users. We offer the most current courses, taught at the latest releases.

Classes offered:

- CICS ■ VSAM
- DB2 ■ IMS/VS DB (DL/1)
- SQL ■ VTAM

We also offer training in the use of our products—RAMIS®, UFO®, InterTest™, and VERIFY. All courses are held at locations throughout the U.S. and Canada, and are also available on-site.

Fire sale

Microsoft shares take off after it reports software OEM deal

The fire that temporarily interrupted trading on Friday was not as hot as the buying spree enjoyed by Microsoft Corp. investors. The software firm announced that it will release the source code for its OS/2 operating system to an OEM. Microsoft closed Thursday at \$34, up 5½ points. Compaq Computer Corp. also enjoyed a good week after rolling out a line of personal computers that are targeted at minicomputer users (see story page 1). Compaq gained 2½ points to finish at \$194.

IBM reported that it will license its microprocessor technology to Micros Technology, Inc. Micros added 116 points to finish at 111%. 3Com Corp., which announced that its next release of 3+Open LAN Manager will support OS/2 and Microsoft technology, climbed 114 points to close at 113%. Intel Corp. investors were cheered by the latest chip sales projections, which were up for the first time since February. Intel climbed 114 points to finish

Dell Computer Corp. announced its entry

into the laptop computer market, and its stock closed at 5%, up $\frac{1}{4}$ of a point. Apple Computer, Inc. finished at 45, up 2% points.

On the downside, Digital Equipment Corp. slid 3% points to close at 36 $\frac{1}{2}$, and IBM dropped 114 points to end at 97 $\frac{1}{2}$.

BRUNNEN PUBLISHING

Compaq

CONTINUED FROM PAGE 1

largest supplier of PCs to move into integrated system sales.

Given the trend toward downsizing, the issue for users may not be whether to swap minis for PCs, but which architecture to rely on, said David George, executive vice-president at Chicago-based PC Quote, a real-time financial services

Bus rolls in

Computer Design's 400 is its first PC to utilize the EISA bus architecture

■ Microprocessor: Intel 486

■ I/O bus: 32-bit EISA; Compaq Flex architecture

■ Clock speed: 35 MHz

■ MIPPS: 15

■ System RAM: 4M bytes (expandable to 160M)

■ Hard disk: 120M, 320M or 650M bytes

■ Floppy disk: 1.2M bytes, 5 1/4 in.

■ Graphics: VGA, EGA, CGA, MDA

■ Price range: \$13,999-\$20,499

first. George has standardized on PCs and has a big investment in IBM's Micro Channel Architecture (MCA); he is leery of Compaq's EISA bus but will consider it.

Interest in the Systempro was high at Drexel Burnham Lambert, Inc., in New York,

Marty Greenwood, Drexel's master of office systems, said industry efforts to move to a client/server architecture over the last two years have been hindered by the performance constraints of PC hardware. "If you try to run a multiuser database on a LAN today, it is difficult to implement a full-scale transaction processing system."

If the Systempro lives up to Compaq's performance claims, it will make it possible to move applications to a PC without sacrificing any performance, Greenwood predicted. "This machine is so much beyond [a mere] 486," he said.

Minicomputer makers such as Digital Equipment Corp. and IBM downplay Compaq's performance claims. Both vendors have plans for 486-based computers.

"The AS/400 is a winner, and tens of thousands of customers will back that up," an IBM spokesman said. The Systempro is better positioned against DEC's low-end, Unix-based Vaxstation 3100 or 5400 than the 6130, said Dean Geran, group marketing manager for PCs and peripherals at DEC. He said "Compaq has stepped over a fine line . . . and overstated [the Systempro's] capability."

Some analysts are not so sure. Mike Geran, vice-presi-

dent of research at Nikko Securities International, said there are some tasks, such as file servers, that can be better served on a price/performance basis on machines like the Systempro or Nystems Systems, Inc.'s Unix-based server.

IBM and DEC are "whistling in the dark," however, argued John Goldberg, a vice-president at International Data Corp. in Framingham, Mass. "They don't realize that Compaq's computers

are very real and that the low end is where the battle is fought for network server and multiprocessor systems," he added.

At the heart of the controversy are performance claims touted by Compaq, based primarily on Neal Nelson & Associates' benchmarks.

For example, a run against a DEC VAX 11/30 from Hewlett-Packard Co.'s 9000 Series 835 in a Unix-based 60-user configuration showed that the roughly \$160,000 Systempro was more than six times faster than the roughly \$1,000,000 DEC VAX and more than three times faster than the \$100,000 HP 9000.

"Compaq beats the DEC machine rather readily on many [tests], whereas with HP, sometimes the 9000 was faster and sometimes the Compaq was," said founder Neal Nelson. He added that tests run with his database of more than 350 megabytes have consistently placed a number of PCs and small multiprocessor systems at the high end of the performance spectrum.

Yet the Systempro's impact

Hardly personal

Compaq's systempro PC architecture provides multi-processing and network capabilities associated with more expensive multiuser systems

Computer System Pro

■ Microprocessor: Single or dual 486; single or dual 386 available
■ I/O bus: 32-bit EISA
■ Clock speed: 35 MHz
■ System RAM: 4M bytes (expandable to 256M bytes)
■ Hard disk: 120M, 320M or 650M bytes
■ Floppy disk: 1.2M bytes, 5 1/4 in.
■ Graphics: VGA, EGA, CGA, MDA
■ Price: \$15,999-\$20,499

Compaq vies for LAN pie

Minicomputer makers may be quick to dismiss as arrogant Compaq bid to grab a slab of their pie, but network server vendors will probably head for the pie safe — and with good reason.

Analysts who are divided over the extent to which Compaq's dual-processor, EISA-based Systempro will affect the midrange market (see story page 1), have on such doubts about its impact on the server market. "The pull-through market [for Systempro] is definitely Unix and network servers," said Bruce Stephen, an analyst at International Data Corp. (IDC). Without any overt push, Compaq has found itself the second largest supplier of network servers, said market researcher Gartner Group, Inc. IDC said Compaq holds 39% of the overall non-dedicated server market and is the No.1 choice for users configuring PCs as servers.

The icing on the cake for Compaq is the successful execution of a joint development agreement with Microsoft Corp. that will result in the

addition of key features to the latter company's core LAN Manager product such as a multiprocessing support architecture that splits protocol overhead and OS/2's High Performance File System onto different CPUs.

While Compaq LAN Manager 386/486 will be offered as an option, Compaq also enjoys support from Novell, Inc. For six months, Computerland has offered users a preconfigured service-based on Compaq hardware bundled with a preloaded Novell Network operating system.

Although Microsoft officials point to Compaq's LAN Manager license and development efforts as proof that the desktop vendor is more committed to LAN manager, Gary Stine, Compaq's senior vice-president of systems engineering, dismissed Network as "offered by Compaq directly while LAN Manager is available only as an OEM product. Compaq was unsuccessful in convincing current LAN Manager licensees to offer a version tailored to Compaq's EISA platform," Stine said.

PATRICIA KEEFE

Grid, NEC join EISA bandwagon

BY RICHARD PASTORE
CW STAFF

The EISA trenches on the PC architecture front got considerably more crowded last week as NBL Technologies, Inc. and Grid Systems Corp. joined in the push for personal computers based on Extended Industry Standard Architecture (EISA) and its forebear, the AT bus.

On the same day as Compaq Computer Corp.'s EISA debut (see story page 1), NEC announced its desktop Powerwave 486/25E and Powerwave 386/33E, based on Intel Corp.'s i486 and 80386 microprocessors, respectively. Both incorporate the EISA bus.

The company has aimed both machines at the high-end user in such intensive application areas as computer-aided engineering and graphics. The personal computers are also positioned as network servers.

The 486/25E runs at 25 MHz and is configured with 2M bytes of random-access memory (RAM), expandable to 32M bytes. The PC ships with a 1.23-MHz, 5 1/4-in. floppy disk drive and a hard disk drive. It

also incorporates a small computer systems interface (SCSI) peripheral controller that is used for the attachment of up to seven devices.

The 486 model will ship in January, according to NEC, and will be priced from \$12,000 to \$14,000 depending on hard disk capacity.

The 386/33E, which runs at 33 MHz, features the same intelligent RAM and expandability factor as well as the SCSI controller. Depending on hard disk capacity, the model will cost from \$8,500 to \$10,000 when it ships in January.

Grid and NEC
NEC also introduced two machines, the Powerwave 386/25 and the multiuser-supporting Businesswave 386/25, based on the EISA bus.

Priced at \$6,400, the Powerwave model is available now. The Businesswave PC will ship next month and will have a price tag of \$8,500, the company said.

Grid, which has already introduced a Micro Channel Architecture-based box, rolled out six models last week, two of which are EISA machines. All six are

designed to be modularly upgradable, company said.

With this modular platform, customers purchasing a 386, 16-MHz model, for instance, can upgrade to a 386, 33-MHz processor or even a 486 processor, according to Goldberg.

The first model, the Grid/25, is based on the i486 microprocessor and runs at a 25-MHz clock speed. The EISA-based machine comes standard with 2M bytes of RAM, expandable to 64M bytes. The \$9,000 computer is scheduled to ship in the fourth quarter.

Grid's 386E/33 model is similar except for its 33-MHz speed, 386 microprocessor and \$7,000 price tag.

The other four models in the line feature AT-style buses and are based on 386 chips. They run at clock speeds ranging from 16 to 33 MHz and range in price from \$3,000 to \$6,000. The models are expected to ship in December or January.

All the configurations come equipped with a 3 1/2-in., 1.44-MHz floppy disk drive. Grid also offers a variety of hard disk drive options and ST-506 enhanced small device interface and SCSI drive controllers.

will depend on a series of factors, not the least of which is whether Compaq can convince information managers to purchase minicomputer-level equipment through computer dealers. Mike Swartz, president of Compaq North America, and the Systempro will not be sold directly.

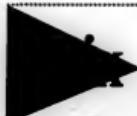

Also, most minicomputers are packed by vertical software packages. Grid, for example, is already moving to entice developers to port their minicomputer-based vertical software to its platform.

Greg Cross, corporate marketing manager at Fact International in Auckland, New Zealand, said the developer has agreed to port its Wang Laboratories, Inc.-based software to the Systempro.

Another obstacle barring the way for the Systempro is IBM's MCA, which has a three-year lead with its installed base.

"This is the second-most exciting announcement of 1987, only it's two years too late," said James A. Cannavino, vice-president and general manager of IBM's Personal Systems Group.

TRENDS

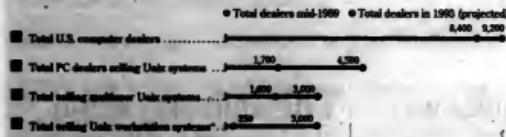

After years of slow growth in specialized markets, Unix shipments are starting to erupt, with the value-added reseller channel and personal computer dealers driving the operating system into broader markets.

PC Unix is the leading variant of Unix, passing AT&T's System V in terms of units shipped and number of licenses.

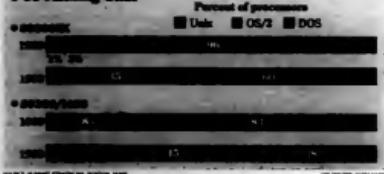

Unix and workstations will both be pulled into broader markets as they begin to lose their niche. By the end of 1993, more than half of all PC dealers could be selling Unix-based systems.

Growth of Unix dealer channel (U.S. dealers)

*Includes variations of Unix capable of running on Intel-based PCs

PCs running Unix

► Unix has made a name for itself in the workstation market. But it has some catching up to do in the Intel-based PC market where DOS and OS/2 have initial leads.

NEXT WEEK

Outsiders have a hard time believing it, says George Bremner, MCA's vice-president of corporate IS, but entertainment is a serious business, and the IS function is as critical to success in a company such as his as it is for manufacturing or consumer products companies. Manager's Journal profiles this New Yorker in Hollywood.

ALICE LEVITT

► Routs of ISDN produce both optimism and frustration. Some companies are able to make immediate use of available services and most see an exciting future, but few can do everything they'd like right now. Executive Report features detailed evaluations of current ISDN performance from those who paid for front-row preview seats.

INSIDE LINES

Display wars update

Don't count out PM Lite — the downsized version of OS/2's Presentation Manager graphical interface running under DOS — just yet. Sources say PM Lite will not have a graphical interface because IBM and purported co-developers cannot get it in under the 1M-byte memory barrier. IBM's Jim Canavino talked with Microsoft's Bill Gates last week in an effort to hash out some sort of an agreement that supposedly would allow both sides to save face, according to those who claim to be in the know. A draft of the agreement supposedly is already on Canavino's desk. Meanwhile, there's also talk of IBM building Microsoft's Windows with an upcoming release of DOS. More rumors that have been trickling out of Microsoft say Windows 3.0 and Omega have been delayed because Microsoft can't get them to perform adequately. Meanwhile, Paul Allen, formerly Microsoft's DOS man and now head of America Online in Bellevue, Wash., reportedly is furious that he has had to withdraw his release of his product because of the Windows 3.0 delay.

Hight stakes in the desert

The Interface Group is charging as much as \$10,000 a week to provide a trailer in the parking lot of the Las Vegas Convention Center for those companies that weren't able to secure a booth inside for the Comdex trade show. Conference rooms have been going for \$30,000.

Once burned, twice shy

After Computerworld received a telephone call from a source claiming to have found the Ping-Pong virus in a program published by Borland, we called Philippe Kahn, Borland's founder, to find out whether there was any merit to the tip. There is absolutely no basis to the story, Kahn said emphatically. This is probably a rumor that is being handled about by the competition, he speculated. "It sounds a lot like the same sort of thing that Microsoft did after the earthquake, when they said we were out of business," Kahn said.

Worlds apart

The Iron Curtain may be coming down, but the powers that be behind the "Bamboo Curtains" seem to be resolutely holding it up against the winds of change. At least that's the view of the Association for Computing Machinery. According to a reliable source, the ACM, which dispatched a stinging rebuke in August to Chinese leaders in the wake of the Tiananmen Square massacre, has turned down an invitation that was recently tendered by the Chinese Computer Federation to visit China.

A trend in the making

Sources say that AT&T is considering going a major step beyond mere collaboration or technology exchanges with its nemesis, the Open Software Foundation (OSF). Robert Kavner, who heads up AT&T's Data Systems Group, reportedly attended the last OSF meeting as an invited guest and was said to give strong indications that AT&T is contemplating spinning off its entire Unix System Operations group into a separate corporation, much as Apple did with its software division, to ally third-party developers fears.

Lessons to be learned

DEC's VMS operating system is one of the most secure available, and the company goes to considerable lengths to instruct system managers in how to make their systems secure, said Steve Redfern, a VMS systems marketing consultant at DEC. In light of recent breaches on scientific DEC-based networks, what's needed is for system managers, many of whom are not properly trained in security procedures, to take security more seriously, according to Redfern. "Security at research and academic institutions is not near and dear to their hearts," he said.

You won't be able to find news tips to News Editor Pete Bartone unless you too have consegnaed to glitz up this week for the annual PC Bell. But Assistant News Editor Jim Connolly is standing by at 800-543-6474 to stay on top of what's happening in the real world.

You'll find our printers exceed specifications in the most crucial area of all. Confidence.

In a world where anything can go wrong, isn't it nice to know something won't? NEC printers. These machines have built the kind of reputation that used to be associated only with National Heroes and World Series MVPs. Steady, reliable, clutch performers.

They are: the Pinwriter® family of dot matrix printers, and the Silentwriter® family of page printers. And their legendary reliability and print quality have inspired spontaneous outbursts of applause on more than one occasion. Our Pinwriter printers are 24-wire workhorses that consistently deliver unmatched print quality, type variety and the highest resolution graphics.

NEC Information Systems, Inc., 1414 Massachusetts Ave., Boxborough, MA 01719. 1-800-NEC-INFO. In Canada, 1-800-343-4418.

© Copyright 1989 NEC Information Systems, Inc. Pinwriter and Silentwriter are registered trademarks of NEC Corp. Postscript is a registered trademark of Adobe Systems, Inc.

Our Silentwriter printers are laser-class printers that are in a class all their own. They offer a

PostScript® interpreter, a wide variety of type fonts, and extensive memory. Which makes them the perfect page printers for desktop publishing environments and work group settings. And they're all from NEC, the \$24 billion world leader in computers and communications. Talk about confidence building.

NEC

WE'RE MAKING THINGS BETTER FOR YOU.

There's only one software company that can lead you into the next millennium.

To meet the challenges that await you in the next age of computing, it only makes sense to follow an experienced guide. A company with a proven track record of success, leadership and technological achievement.

McCormack & Dodge is just that company. We can point to a 20-year history of leadership in Human Resource and Financial software. A history marked by accomplishments like the first truly

integrated processing environment - Millennium®. The first DB2 systems development tool from an applications software vendor. And now, the first true SAA workstation.

Call 1-800-343-0325 and ask for our white paper which describes in detail how McCormack & Dodge is dealing with your concerns about SAA. You'll find out why our 20 years of success is just what you need to face the next 20 years of change.

20 YEARS OF SUCCESS IN FINANCIAL AND HUMAN RESOURCE SOFTWARE.

McCormack & Dodge
